The Adaptive Immune Receptor Repertoire (AIRR) Community of The Antibody Society is a research-driven group that is organizing and coordinating stakeholders in the use of next-generation sequencing (NGS) technologies to study antibody/B-cell and T-cell receptor repertoires. Recent advances in sequencing technology have made it possible to sample the immune repertoire in exquisite detail. AIRR sequencing has enormous promise for understanding the dynamics of the immune repertoire in vaccinology, infectious disease, autoimmunity, and cancer biology, but also poses substantial challenges. The AIRR Community was established to meet these challenges.

INTRODUCTION TO THE AIRR STANDARDS

The AIRR Community is developing a set of standards for describing, reporting, storing, and sharing adaptive immune receptor repertoire (AIRR) data, such as sequences of antibodies and T cell receptors (TCRs). Some specific efforts include:

- The MiAIRR standard for describing minimal information about AIRR datasets, including sample collection and data processing information.
- Data submission guidelines and workflows.
- Data representations (file format) specifications for storing large amounts of annotated AIRR data.
- API to query and download AIRR data from repositories/databases as part of the AIRR Data Commons.
- A community standard for software tools which will allow conforming tools to gain community recognition.
- Set of reference software tools for reading, writing and validating data in the AIRR standards.
- A database and web submission frontend for inferred germline genes

CHAPTER

TWO

TABLE OF CONTENTS

2.1 Getting Started

This website provides information and resources regarding the AIRR Community Standards for the diverse community of immunology researchers, bioinformaticians, and software developers.

2.1.1 MiAIRR standard for study data submission

- Gather experimental and analysis information about your study to conform to the *MiAIRR* standard (minimal information about adaptive immune receptor repertoires).
- Submission of your study data to a public repository.

2.1.2 AIRR Data Commons for query and download of AIRR-seq data

• Query publicly available AIRR-seq studies in the AIRR Data Commons.

2.1.3 Resources related to data representations and software development

- Schema, definitions and file formats for the *AIRR Data Model*. The AIRR Data Model defines the structure and relationship for the MiAIRR data elements.
- Software guidelines for tools developers to enable rigorous and reproducible immune repertoire research.
- AIRR Data Commons API provides programmatic access to query and download AIRR-seq data.

2.1.4 Software tools and libraries

- Python reference library for reading/writing/validating AIRR data files.
- *R reference library* for reading/writing/validating AIRR data files.
- ADC API reference implementation for a local data repository.
- *Resources and tools* that support the AIRR Standards.

2.1.5 Tutorials, examples and workflows

AIRR Rearrangement TSV Interoperability Example

The example that follows illustrates the interoperability provided by the AIRR Rearrangement schema. The code provided demonstrates how to take AIRR formatted data output by IgBLAST and combine it with data processed by IMGT/HighV-QUEST that has converted to the AIRR format by Change-O. Then, the merged output of these two distinct tools is used to (a) create MiAIRR compliant GenBank/TLS submission files, and (b) perform a simple V gene usage analysis task.

Data

We've hosted a small set of example data from BioProject PRJNA338795 (Vander Heiden et al, 2017. J Immunol.) containing both input and output of the example. It may be downloaded from:

Example Data

Walkthrough

Environment setup

We'll use the Immcantation docker image for this example, which comes loaded with all the tools used in the steps that follow:

```
# Download the image
docker pull kleinstein/immcantation:devel
# Invoke a shell session inside the Immcantation docker image
# Map example data (~/data) to the container's /data directory
$> docker run -it -v ~/data:/data:z kleinstein/immcantation:devel bash
```

Generate AIRR formatted TSV files

TSV files compliant with the AIRR Rearrangement schema may be output directly from IgBLAST v1.9+ or generated from IMGT/HighV-QUEST output (or IgBLAST <=1.8 ouput) using the MakeDb parser provided by Change-O:

```
# Generate TSV directly with IgBLAST
$> cd /data
$> export IGDATA=/usr/local/share/igblast
$> igblastn -query HD13M.fasta -out HD13M_fmt19.tsv -outfmt 19 \
      -germline_db_V $IGDATA/database/imgt_human_ig_v \
      -germline_db_D $IGDATA/database/imgt_human_ig_d \
      -germline_db_J $IGDATA/database/imgt_human_ig_j \
      -auxiliary_data $IGDATA/database/imgt_human_ig_j \
      -auxiliary_data $IGDATA/optional_file/human_gl.aux \
      -ig_seqtype Ig -organism human \
      -domain_system imgt
# Generate TSV from IMGT/HighV-QUEST results using changeo:MakeDb
$> MakeDb.py imgt -i HD13N_imgt.txz -s HD13N.fasta \
      --scores --partial --format airr
```

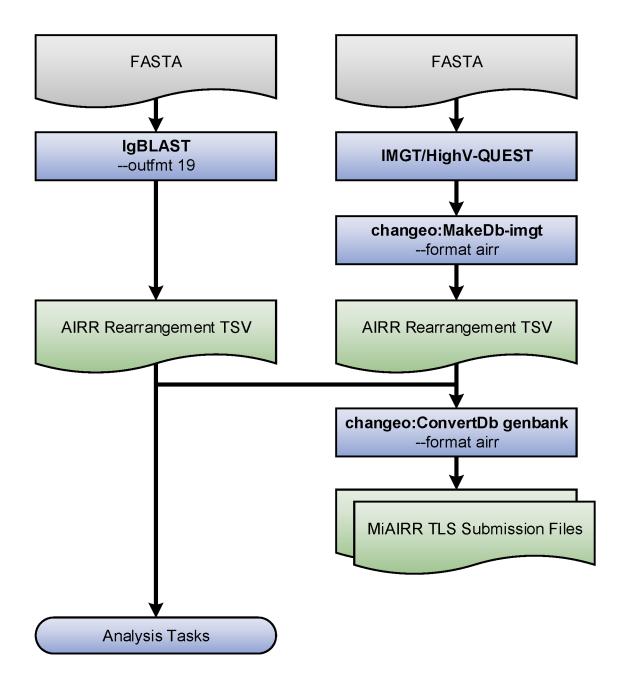

Fig. 1: Flowchart of the example steps.

Generate GenBank/TLS submission files

AIRR TSV files can be input directly in Change-O's ConvertDb-genbank tool to generate MiAIRR compliant files for submission to GenBank/TLS:

```
# Generate ASN files from IgBLAST output
$> ConvertDb.py genbank -d HD13M_fmt7_db-pass.tsv --format airr \
    --inf IgBLAST:1.7.0 --organism "Homo sapiens" \
    --tissue "Peripheral blood" --cell "naive B cell" \
    --id --asn -sbt HD13M.sbt
# Generate ASN files from IMGT/HighV-QUEST output
$> ConvertDb.py genbank -d HD13N_imgt_db-pass.tsv --format airr \
    --inf IMGT/HighV-QUEST:1.5.7.1 --organism "Homo sapiens" \
    --tissue "peripheral blood" --cell "naive B cell" \
    --cregion c_call --id --asn -sbt HD13M.sbt
```

Merge files and count V family usage

AIRR TSV files from different tools and easy combined to perform analysis on data generated using different software. Below is shown a simple V family usage analysis after merging the IgBLAST and IMGT/HighV-QUEST outputs into a single table:

```
# Count V family usage in R
# Imports
$> R
R> library(alakazam)
R> library(dplyr)
R> library(ggplot2)
# Merge IgBLAST and IMGT/HighV-QUEST results
R> db_m <- read.delim("HD13M_fmt7_db-pass.tsv")</pre>
R> db_n <- read.delim("HD13N_imgt_db-pass.tsv")</pre>
R> db_m$cell_type <- "memory"</pre>
R> db_n$cell_type <- "naive"</pre>
R> db <- bind_rows(db_m, db_n)</pre>
# Subset to heavy chain
R> db <- subset(db, grepl("IGH", v_call))</pre>
# Count combined V gene usage
R> v_usage <- countGenes(db, "v_call", groups="cell_type",</pre>
                          mode="family")
# Plot V family usage
R> ggplot(v_usage, aes(x=GENE, y=SEQ_FREQ, fill=cell_type)) +
    geom_col(position="dodge") +
    scale_fill_brewer(name="Cell type", palette="Set1") +
    xlab("") +
    ylab("Fraction of repertoire")
```

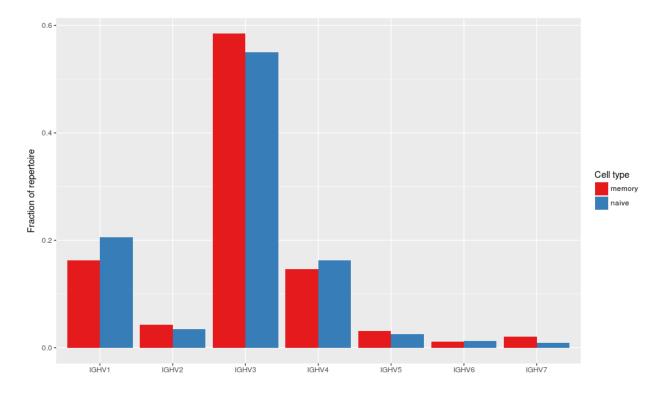

Fig. 2: V family usage for the combined data set.

ADC API Query and Analysis Example

This example shows how repertoires and associated rearrangments may be queried from a data repository using the ADC API and then a simple analysis is performed. The example is split between two python scripts; one that performs the query and saves the data into files, and another that reads the data from the files and generates a grouped CDR3 amino acid length distribution plot. The two scripts could be combined into one, but this example illustrates how the data can be saved into files for later use. The example uses the AIRR standards python library.

Data

This example retrieves data for the following study, which is identified by NCBI BioProject PRJNA300878. In this example, we are only going to query and retrieve the T cell repertoires.

Rubelt, F. et al., 2016. Individual heritable differences result in unique cell lymphocyte receptor repertoires of naive and antigen-experienced cells. Nature communications, 7, p.11112.

Basic study description:

- 5 pairs of human twins
- B-cells and T-cells sequenced
- · B-cells sorted into naive and memory
- T-cells sorted into naive CD4, naive CD8, memory CD4 and memory CD8
- Total of 60 repertoires: 20 B-cell repertoires and 40 T-cell repertoires

Walkthrough

We'll use the airr-standards docker image for this example, which comes loaded with all the python packages needed. You will want to map a local directory inside the docker container so you can access the data and analysis results afterwards:

```
# Download the image
docker pull airrc/airr-standards:latest
# Make local temporary directory to hold the data
mkdir adc_example
cd adc_example
# Invoke a shell session inside the docker image
docker run -it -v $PWD:/data airrc/airr-standards:latest bash
```

The first python script queries the data from the VDJServer data repository and saves them into files:

```
# Query the data
cd /data
python3 /airr-standards/docs/examples/api/retrieve_data.py
```

Only a subset of the data is downloaded for illustration purposes, but review the code to see how all data can be downloaded. A total of 40 repertoires and 300,178 rearrangements should be downloaded. The repertoire metadata is saved in the repertoires.airr.json file, and the rearrangements are saved in the rearrangements.tsv file. The script should take a few minutes to run and produce the following display messages:

```

```

The second python script loads the data from the files and generates a CDR3 amino acid length distribution that is grouped by the T cell subset. This study performs flow sorting to generate four T cell subsets: naive CD4+, naive CD8+, memory CD4+, memory CD8+. The script uses the repertoire metadata to determine the T cell subset for the rearrangement, tabulates the counts, normalizes them, and generates a grouped bar chart with the results:

```
# Run the analysis
python3 /airr-standards/docs/examples/api/analyze_data.py
```

The figure is placed in the plot.png file and should look like this:

CDR3 AA Length Histogram

Fig. 3: CDR3 AA Length Histogram grouped by T cell subsets.

Scientific Query Scenarios for AIRR Data Commons API

The AIRR Common Repository Working Group (CRWG) has defined a number of sample scientific query scenarios to guide the design of the ADC API. The Design Decisions document lists the major design choices for the API, and the *API* is currently defined using the OpenAPI V2.0 Specification. This document describes the query examples with associated JSON definitions that can be submitted to an AIRR repository.

There are two main query endpoints in the API: /repertoire for querying MiAIRR-compliant study metadata and /rearrangement for querying rearrangement annotations. Most scientific queries will involve both endpoints. The basic workflow involves first querying /repertoire to get the list of repertoires that meet the search criteria on study, subject, and sample metadata. Secondly, the identifiers from the repertoires in the first query are passed to the /rearrangement endpoint along with any search criteria on the rearrangement annotations. The resultant rearrangements can be downloaded as JSON or in the *AIRR TSV format*.

Query Example

What human full length TCR-beta sequences have junction amino acid sequence: "CASSYIKLN"?

• The JSON query definition for /repertoire endpoint. The ontology identifier 9606 requests human and TRB is the locus of interest.

```
{
    "filters":{
        "op":"and"
        "content": [
            {
                 "op":"="
                 "content": {
                     "field":"subject.organism.id",
                     "value":"9606"
                 }
            },
            {
                 "op":"="
                 "content": {
                     "field":"sample.pcr_target.pcr_target_locus",
                     "value":"TRB"
                 }
            }
        ]
    }
}
```

• That query does not request full length sequences. We can enhance the query by adding a clause for the sample. complete_sequences field.

(continued from previous page)

```
"value": "NCBITAXON: 9606"
            }
        },
        {
            "op":"=",
            "content": {
                 "field":"sample.pcr_target.pcr_target_locus",
                 "value":"TRB"
            }
        },
        {
            "op":"or",
            "content":[{
                 "op":"="
                 "content": {
                     "field": "sample.complete_sequences",
                     "value":"complete"
                 }
            },
            {
                 "op":"=",
                 "content": {
                     "field": "sample.complete_sequences",
                     "value":"complete+untemplated"
                 }
            }]
        }]
    }
}
```

• The JSON query definition for /rearrangement endpoint. The repertoire identifiers (repertoire_id) in the query are just examples, you would replace them with the actual identifiers returned from the above repertoire query. The query performs an exact match of the junction amino acid sequence.

```
{
    "filters":{
        "op":"and",
        "content": [
            {

2.2 Release Notes

2.2.1 Schema Release Notes

Version 1.4.1: August 27, 2022

Version 1.4 schema release.

New General Purpose Schema:

- 1. Introduced the experimental DataFile object, which defines a JSON file holding Repertoire metadata, data processing analysis objects, or any object in the AIRR Data Model.
- 2. Introduced the experimental RepertoireGroup Schema for describing collections of repertoires to be analyzed together.
- 3. Introduced the experimental InfoObject Schema, which provides information about data and ADC API responses.
- 4. Introduced the experimental TimePoint Schema for defining the time point at which an observation or other action was performed.

New Germline and Genotype Schema:

The following experimental schema were introduced to support storage of VDJ germline reference sequences, VDJ genotypes, and MHC genotypes:

- 1. GermlineSet: Defines a collection of AlleleDescriptions from the same strain or species.
- 2. AlleleDescription: Details of a putative or confirmed Ig receptor gene/allele inferred from one or more observations.
- 3. RearrangedSequence: Details of a directly observed rearranged sequence or an inference from rearranged sequences contributing support for a gene or allele.
- 4. UnrearrangedSequence: Details of an unrearranged sequence contributing support for a gene or allele.
- 5. SequenceDelineationV: Delineation of a V-gene in a particular system.
- 6. GenotypeSet: Defines a collection a VDJ genotypes for a given subject.
- 7. Genotype: Enumerates the alleles and gene deletions inferred in a single subject for a single locus.
- 8. MHCGenotypeSet: Defines a collection of MHC genotypes for a given subject.
- 9. MHCGenotype: Details the genotype of major histocompatibility complex (MHC) class I, class II and nonclassical loci.

10. Acknowledgement: Defines contributors to the germline or genotype description.

New Single-cell Schema:

The following experimental schema were introduced to improve support for single-cell data and extend the Cell schema.

- 1. CellExpression: Defines a container to store single-cell expression level measurements.
- 2. Receptor: Describes a complete receptor protein sequence and its reactivity.

Rearrangement Schema:

- 1. Added the optional fields v_frameshift, j_frameshift, d_frame and d2_frame defining annotations related to alignment reading frames.
- 2. Added the optional field umi_count to represent the count of distinct UMIs for a sequence.
- 3. Modified the definition of duplicate_count to remove ambiguity with the new umi_count field in a singlecell context. There is now a distinction between duplicate observed sequences (duplicate_count) and UMIs (umi_count).
- 4. The optional quality and quality_alignment alignment fields were added to store Phred quality scores for base calls in the sequence and sequence_alignment fields, respectively.
- 5. The following optional fields were added to denote constant region (c_call) alignment positions: c_sequence_start, c_sequence_end, c_germline_start, c_germline_end, c_alignment_start, c_alignment_end.

Study Schema:

- 1. Added the optional fields study_contact to store contact information for the primary study contact.
- Modified the enumerated values supported by keywords_study to the following set: contains_ig, contains_tr, contains_paired_chain, contains_schema_rearrangement, contains_schema_clone, contains_schema_cell, contains_schema_receptor
- 3. Added the optional fields adc_publish_date and adc_update_data that timestamp AIRR Data Commons initial publication and last update, respectively.

Subject Schema:

1. Added the optional genotype field linking to the new GenotypeSet and MHCGenotypeSet objects.

Sample Schema:

- 1. Added the required field collection_time_point_relative_unit defining the units for the sample collection timestamp.
- 2. Modified the type of the field collection_time_point_relative from a string to a number defined in combination with the new unit ontology field collection_time_point_relative_unit.

NucleicAcidProcessing Schema:

- 1. Added the required field template_amount_unit defining the units for the input template quantification.
- 2. Modified the type of the template_amount field from a string to a number defined in the combination with the new unit ontology field ``template_amount_unit`.

Clone Schema:

- 1. Added the optional clone_count field to specify absolute count of clonal members.
- 2. Added the optional umi_count field to specify the total UMI count of all clonal members.

Cell Schema:

1. Removed the field expression_tabular whose functionality has been replaced by the new CellExpression schema.

Version 1.3.1: October 13, 2020

Version 1.3 documentation patch release.

Alignment Schema:

1. Added the deprecation tags for rearrangement_id, which were accidentally left out of the v1.3.0 release.

Version 1.3.0: May 28, 2020

Version 1.3 schema release.

New Schema:

- 1. Introduced the Repertoire Schema for describing study meta data.
- 2. Introduced the PCRTarget Schema for describing primer target locations.
- 3. Introduced the SampleProcessing Schema for describing experimental processing steps for a sample.
- 4. Replaced the SoftwareProcessing schema with the DataProcessing schema.
- 5. Introduced experimental schema for clonal clusters, lineage trees, tree nodes, and cells as Clone, Tree, Node, and Cell objects, respectively.

General Updates:

- 1. Added multiple additional attributes to a large number of schema propertes as AIRR extension attributes in the x-airr field. The new Attributes object contains definitions for these x-airr field attributes.
- 2. Added the top level required property to all relevant schema objects.
- 3. Added the title attribute containing the short, descriptive name to all relevant schema object fields.
- 4. Added an example attribute containing an example data value to multiple schema object fields.

AIRR Data Commons API:

1. Added OpenAPI V2 specification (specs/adc-api.yaml) for AIRR Data Commons API major version 1.

Ontology Support:

- 1. Added Ontology and CURIEResolution objects to support ontologies.
- 2. Added vocabularies/ontologies as JSON string for: Cell subset, Target substrate, Library generation method, Complete sequences, Physical linkage of different loci.

Rearrangement Schema:

- 1. Added the complete_vdj field to annotate whether a V(D)J alignment was full length.
- 2. Added the junction_length_aa field defining the length of the junction amino acid sequence.
- 3. Added the repertoire_id, sample_processing_id, and data_processing_id fields to serve as linkers to the appropriate metadata objects.
- 4. Added a controlled vocabulary to the locus field: IGH, IGI, IGK, IGL, TRA, TRB, TRD, TRG.
- 5. Deprecated the rearrangement_set_id and germline_database fields.
- 6. Deprecated rearrangement_id field and made the sequence_id field be the primary unique identifer for a rearrangement record, both in files and data repositories.

- 7. Added support secondary D gene rearrangement through the additional fields: d2_call, d2_score, d2_identity, d2_support, d2_cigar np3, np3_aa, np3_length, n3_length, p5d2_length, p3d2_length, d2_sequence_start, d2_sequence_end, d2_germline_start, d2_germline_start, d2_alignment_start, d2_alignment_end, d2_sequence_alignment, d2_sequence_alignment_aa, d2_germline_alignment, d2_germline_alignment_aa.
- 8. Updated field definitions with more concise V(D)J call descriptions.

Alignment Schema:

- 1. Deprecated the rearrangement_set_id and germline_database fields.
- 2. Added the data_processing_id field.

Study Schema:

1. Added the study_type field containing an ontology defined term for the study design.

Subject Schema:

- 1. Deprecated the organism field in favor of the new species field.
- 2. Deprecated the age field.
- 3. Introduced age ranges: age_min, age_max, and age_unit.

Diagnosis Schema:

1. Changed the type of the disease_diagnosis field from string to Ontology.

Sample Schema:

1. Changed the type of the tissue field from string to Ontology.

CellProcessing Schema:

- 1. Changed the type of the cell_subset field from string to Ontology.
- 2. Introduced the cell_species field which denotes the species from which the analyzed cells originate.

NucleicAcidProcessing Schema:

- 1. Defined the template_class field as type string.
- 2. Added a controlled vocabulary the library_generation_method field.
- 3. Changed the controlled vocabulary terms of complete_sequences. Replacing complete & untemplated with complete+untemplated and adding mixed.
- 4. Added the pcr_target field referencing the new PCRTarget schema object.

SequencingRun Schema:

- 1. Added the sequencing_run_id field which serves as the object identifer field.
- 2. Added the sequencing_files field which links to the RawSequenceData schema objects defining the raw read data.

RawSequenceData Schema:

- 1. Added the file_type field defining the sequence file type. This field is a controlled vocabulary restricted to: fasta, fastq.
- 2. Added the paired_read_length field defining mate-pair read lengths.
- 3. Defined the read_direction and paired_read_direction fields as type string.

DataProcessing Schema:

- 1. Replaces the SoftwareProcessing object.
- 2. Added data_processing_id, primary_annotation, data_processing_files, germline_database and analysis_provenance_id fields.

Version 1.2.1: Oct 5, 2018

Minor patch release.

- 1. Schema gene vs segment terminology corrections
- 2. Added Info object
- 3. Updated cell_subset URL in AIRR schema

Version 1.2.0: Aug 18, 2018

Peer reviewed released of the Rearrangement schema.

- 1. Definition change for the coordinate fields of the Rearrangement and Alignment schema. Coordinates are now defined as 1-based closed intervals, instead of 0-based half-open intervals (as previously defined in v1.1 of the schema).
- 2. Removed foreign study_id fields
- 3. Introduced keywords_study field

Version 1.1.0: May 3, 2018

Initial public released of the Rearrangement and Alignment schemas.

- 1. Added required and nullable constrains to AIRR schema.
- 2. Schema definitions for MiAIRR attributes and ontology.
- 3. Introduction of an x-airr object indicating if field is required by MiAIRR.
- 4. Rename rearrangement_set_id to data_processing_id.
- 5. Rename study_description to study_type.
- 6. Added physical_quantity format.
- 7. Raw sequencing files into separate schema object.
- 8. Rename Attributes object.
- 9. Added primary_annotation and repertoire_id.
- 10. Added diagnosis to repertoire object.
- 11. Added ontology for organism.
- 12. Added more detailed specification of sequencing_run, repertoire and rearrangement.
- 13. Added repertoire schema.
- 14. Rename definitions.yaml to airr-schema.yaml.
- 15. Removed c_call, c_score and c_cigar from required as this is not typical reference aligner output.
- 16. Renamed vdj_score, vdj_identity, vdj_evalue, and vdj_cigar to score, identity, evalue, and cigar.

- 17. Added missing c_identity and c_evalue fields to Rearrangement spec.
- 18. Swapped order of N and S operators in CIGAR string.
- 19. Some description clean up for consistency in Rearrangement spec.
- 20. Remove repeated objects in definitions.yaml.
- 21. Added Alignment object to definitions.yaml.
- 22. Updated MiARR format consistency check TSV with junction change.
- 23. Changed definition from functional to productive.

Version 1.0.1: Jan 9, 2018

MiAIRR v1 official release and initial draft of Rearrangement and Alignment schemas.

2.2.2 Python Library Release Notes

Version 1.4.1: August 27, 2022

General:

- 1. Updated pandas requirement to 0.24.0 or higher.
- 2. Added support for missing integer values (NaN) in load_rearrangement by casting to the pandas Int64 data type.
- 3. Added gzip support to read_rearrangement.
- 4. Significant internal refactoring to improve schema generalizability, harmonize behavior between the python and R libraries, and prepare for AIRR Standards v2.0.
- 5. Fixed a bug in the validate subcommand of airr-tools causing validation errors to only be reporting for the first invalid file when multiple files were specified on the command line.

Data Model and Schema:

- 1. Added support for arrays of objects in a single JSON or YAML file.
- 2. Added support for the AIRR Data File and associated schema (DataFile, Info). The Data File data format holds AIRR object of multiple types and is backwards compatible with Repertoire metadata.
- 3. Added support for the new germline and genotyping schema (GermlineSet, GenotypeSet) and associated schema.
- 4. Renamed schema.CachedSchema to schema.AIRRSchema.
- 5. Removed specs/blank.airr.yaml.

Deprecations:

- 1. Deprecated load_repertoire. Use read_airr instead.
- 2. Deprecated write_repertoire. Use write_airr instead.
- 3. Deprecated validate_repertoire. Use validate_airr instead.
- 4. Deprecated repertoire_template. Use schema.RepertoireSchema.template instead.
- 5. Deprecated the commandline tool airr-tools validate repertoire. Use airr-tools validate airr instead.

Version 1.3.1: October 13, 2020

- 1. Refactored merge_rearrangement to allow for larger number of files.
- 2. Improved error handling in format validation operations.

Version 1.3.0: May 30, 2020

- 1. Updated schema set to v1.3.
- 2. Added load_repertoire, write_repertoire, and validate_repertoire to airr.interface to read, write and validate Repertoire metadata, respectively.
- 3. Added repertoire_template to airr.interface which will return a complete repertoire object where all fields have null values.
- 4. Added validate_object to airr.schema that will validate a single repertoire object against the schema.
- 5. Extended the airr-tools commandline program to validate both rearrangement and repertoire files.

Version 1.2.1: October 5, 2018

1. Fixed a bug in the python reference library causing start coordinate values to be empty in some cases when writing data.

Version 1.2.0: August 17, 2018

- 1. Updated schema set to v1.2.
- 2. Several improvements to the validate_rearrangement function.
- 3. Changed behavior of all *airr.interface* functions to accept a file path (string) to a single Rearrangement TSV, instead of requiring a file handle as input.
- 4. Added base argument to RearrangementReader and RearrangementWriter to support optional conversion of 1-based closed intervals in the TSV to python-style 0-based half-open intervals. Defaults to conversion.
- 5. Added the custom exception ValidationError for handling validation checks.
- 6. Added the validate argument to RearrangementReader which will raise a ValidationError exception when reading files with missing required fields or invalid values for known field types.
- 7. Added validate argument to all type conversion methods in Schema, which will now raise a ValidationError exception for value that cannot be converted when set to True. When set False (default), the previous behavior of assigning None as the converted value is retained.
- 8. Added validate_header and validate_row methods to Schema and removed validations methods from RearrangementReader.
- 9. Removed automatic closure of file handle upon reaching the iterator end in RearrangementReader.

Version 1.1.0: May 1, 2018

Initial release.

2.2.3 Release Notes

Version 1.4.1: August 27, 2022

Significant internal refactoring to improve schema generalizability, harmonize behavior between the python and R libraries, and prepare for AIRR Standards v2.0.

Rearrangement:

- Added the aux_types argument to read_tabular, read_rearrangement, and read_alignment to allow explicit declaration of the type for fields that are not defined in the schema.
- Renamed read_airr, write_airr, and validate_airr to read_tabular, validate_tabular, and validate_tabular, respectively.

Data Model and Schema:

- Defined new read_airr, write_airr, and validate_airr functions that support AIRR Data Model files that store arrays of objects in JSON or YAML.
- Added support for the AIRR Model Data File and associated schema (DataFile, Info). The Data File data format holds AIRR object of multiple types and is backwards compatible with Repertoire metadata.
- Added support for the new germline and genotyping schema (GermlineSet, GenotypeSet) and associated schema.

Version 1.3.0: May 26, 2020

- Updated schema set to v1.3.
- Added info slot to Schema object containing general schema information.

Version 1.2.0: August 17, 2018

- Updated schema set to v1.2.
- Changed defaults to base="1" for read and write functions.
- Updated example TSV file with coordinate changes, addition of germline_alignment data and simplification of sequence_id values.

Version 1.1.0: May 1, 2018

Initial release.

2.3 AIRR Standards

Information about all of the AIRR Community standards.

2.3.1 Introduction to MiAIRR

Summary

One of the primary initiatives of the Adaptive Immune Receptor Repertoire (AIRR) Community has been to develop a set of metadata standards for the submission of AIRR sequencing datasets. This work has been carried out by the AIRR Community Minimal Standards Working Group. In order to support reproducibility, standard quality control, and data deposition in a common repository, the AIRR Community has agreed to six high-level data sets that will guide the publication, curation and sharing of AIRR-Seq data and metadata: Study and subject, sample collection, sample processing and sequencing, raw sequences, processing of sequence data, and processed AIRR sequences. The detailed data elements within these sets are defined *here* (Download as TSV).

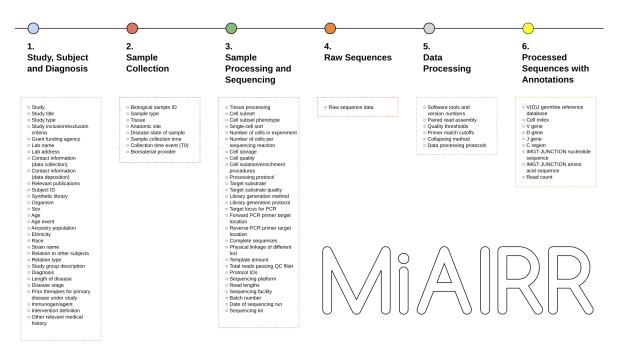

Fig. 4: Schema of MiAIRR data sets and the individual data elements of each set.

Topics

MiAIRR Data Elements

The AIRR Community has agreed to six high-level data sets that will guide the publication, curation and sharing of AIRR-Seq data and metadata: Study and subject, sample collection, sample processing and sequencing, raw sequences, processing of sequence data, and processed AIRR sequences.

Download as TSV.

MiAIRR-to-NCBI Implementation

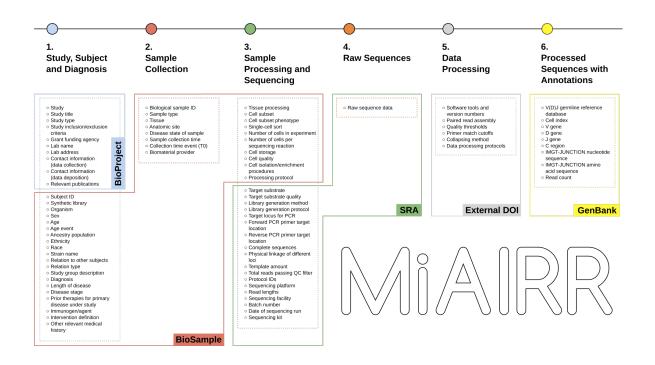

Authors Christian E. Busse, Florian Rubelt and Syed Ahmad Chan Bukhari

Guide for submission of AIRR-seq data to NCBI

This site provides a detailed "how-to" guide for submission of AIRR-seq data to **NCBI repositories** (BioProject, BioSample, SRA and GenBank). For other implementations of the MiAIRR standard see here.

One of the primary initiatives of the AIRR (Adaptive Immune Receptor Repertoire) Community has been to develop a set of metadata standards for the submission of immune receptor repertoire sequencing datasets. This work has been carried out by the AIRR Community Standards Working Group. In order to support reproducibility, standard quality control, and data deposition in a common repository, the AIRR Community has agreed to six high-level data sets that will guide the publication, curation and sharing of AIRR-Seq data and metadata: Study and subject, sample collection, sample processing and sequencing, raw sequences, processing of sequence data, and processed AIRR sequences. The detailed data elements within these sets are defined *here* (Download as TSV). The association between these AIRR sets, the associated data elements, and each of the NCBI repositories is shown below:

Submission of AIRR sequencing data and metadata to NCBI's public data repositories consists of five sequential steps:

- 1. Submit study information to NCBI BioProject using the NCBI web interface.
- 2. Submit sample-level information to the NCBI BioSample repository using the AIRR-BioSample templates.
- 3. Submit raw sequencing data to NCBI SRA using the AIRR-SRA data templates.
- 4. Generate a DOI for the protocol describing how raw sequencing data were processed using Zenodo.
- 5. Submit processed sequencing data with sequence-level annotations to GenBank using AIRR feature tags.

The submission manual provides step-by-step instructions on carrying out these steps for an AIRR study submission.

MiAIRR-to-NCBI Submission Manual

Scope of this document

Provide a user manual describing the submission of AIRR data using the NCBI reference implementation described in [Rubelt_2017]. This implementation uses NCBI's BioProject, BioSample, Sequence Read Archive (SRA) and Gen-Bank repositories and metadata standards to report AIRR data.

Step 1. MiAIRR data submission to BioProject, BioSample and SRA

Since we propose to include a combination of raw and processed sequence data, the AIRR standard will sometimes need to be distributed and linked across multiple repositories (e.g., data in SRA linked to related data in GenBank). Besides, the data elements that comprise the standard will be mapped to ontologies in BioPortal through NIH CDE (Common Data Element) terms. These linkages will support more sophisticated validation and logical inference.

There are three main alternatives to submit raw AIRR data/metadata to NCBI repositories: (1) CEDAR's CAIRR pipeline; (2) NCBI's Web interface; and (3) NCBI's FTP server. These alternatives are described below:

Option 1. Submission via the CEDAR system (CAIRR submission pipeline)

CEDAR's CAIRR submission pipeline helps investigators and curators to edit and validate ontology-controlled metadata. This pipeline provides a seamless interface to transmit SRA datasets to the NCBI SRA and BioSample repositories from the CEDAR Workbench. The pipeline can be directly be accessed at http://cairr.airr-community.org. Note that the CEDAR template and template elements used by this pipeline are publicly available in the following CEDAR folder: All/Shared/Shared by CEDAR/MiAIRR.

Submission steps:

1. Open CEDAR's MiAIRR template by clicking on http://cairr.airr-community.org. If you are not already logged in, this will take you to the CEDAR login panel. If you are a new user, you will have to create an account on the CEDAR Workbench by clicking here.

Email	
Password	
Remember me Forgot Password?	
New user? Register g Google+ GitHub GitHub	
Watch the video tutorial	

2. After logging in into the system, you will see the 'MiAIRR' template. Fill out the template fields with your metadata. Fields with an asterisk (*) are mandatory. Your submission will fail if any mandatory fields are not completed. If information is unavailable for any mandatory field, please enter 'not collected', 'not applicable' or 'missing' as appropriate. Note that you will need to enter a BioProject ID into the field 'Study ID'. If you do not have a BioProject yet, you can create one at *https://submit.ncbi.nlm.nih.gov/subs/bioproject/*

CANCEL VALIDATE SAVE	

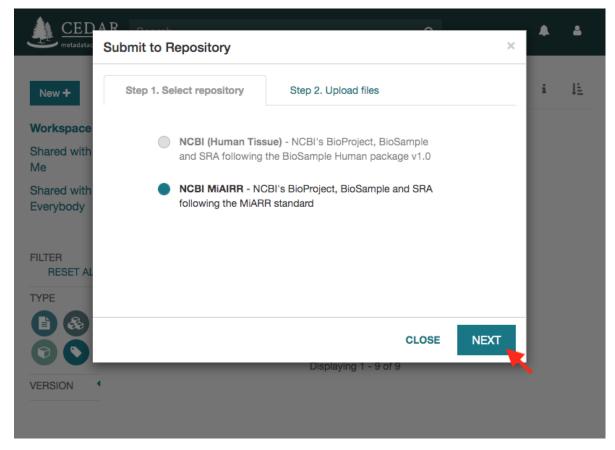

- 4. Go to your personal workspace by clicking on the left arrow (top left corner) and then on the 'Workspace' link, or by just clicking on: https://cedar.metadatacenter.org
- 5. Once in your workspace, you will see a metadata file called 'MiAIRR metadata'. That file contains the metadata that you have just created and that you want to submit to the NCBI. Click on the three vertical dots on the top-right corner of the file icon to see the available file options.

<u>EEDAR</u> metadatacenter.org			Q		•	å

11. Proceed with deposit of processed data, below.

Citing the CAIRR pipeline

Bukhari, Syed Ahmad Chan, Martin J. O'Connor, Marcos Martínez-Romero, Attila L. Egyedi, Debra Debra Willrett, John Graybeal, Mark A. Musen, Florian Rubelt, Kei H. Cheung, and Steven H. Kleinstein. The CAIRR pipeline for submitting standards-compliant B and T cell receptor repertoire sequencing studies to the NCBI. Frontiers in Immunology 9 (2018): 1877. DOI: 10.3389/fimmu.2018.01877

Tell Us About It

Please let us know how it went! If you are willing, we would love to have your comments in a short survey, it should just take 5 minutes or so. We also welcome entry of issues and requests in our GitHub repository, and emails can be sent to cedar-users@lists.stanford.edu. Both of these resources are publicly visible.

Support or Contact

Having trouble with NCBI submission process through our pipeline? Please email to Syed Ahmad Chan Bukhari or to Marcos Martínez-Romero and we will help you sort it out.

Option 2. Submission via NCBI's web interface

To facilitate AIRR data submissions to NCBI repositories, we have developed the NCBI-compliant metadata submission templates both for single and bulk AIRR data submissions. NCBI provides a web-based interface to create a BioProject and allows to BioSample, Sequence Read Archive (SRA) and GenBank metadata via tab-delimited files for single BioProject related data files submission.

Submitting AIRR data and associated metadata to the Bioproject, BioSample and SRA repositories via NCBI's web interface follows in general the submission procedure described in [NCBI_NBK47528], but uses AIRR-specific template for metadata submission:

- 1. Go to https://submit.ncbi.nlm.nih.gov/subs/sra/ and login with your NCBI account (create an account if necessary).
- 2. Click on "create new submission". You will see a form as below. Fill the form with required information and click on "continue".

- 5. The AIRR BioSample template is not yet listed on the NCBI website. The template sheet AIRR_BioSample_V1. 0.xls can be downloaded from https://github.com/airr-community/airr-standards/tree/master/NCBI_ implementation/templates_XLS. Fill in the required field and save the file as *tab-delimited* text file (.TSV format), then upload it.
- 6. To submit the SRA metadata use the AIRR_SRA_v1.0.xls file. Make sure that the column sample_name uses sample names that match the record in the BioSample template (if new BioSamples are being submitted) or a previously entered record. Also this file must be saved as *tab-delimited* text file for upload.
- 7. Submit the raw sequence file.
- 8. Complete the submission.
- 9. Proceed with deposit of processed data, below.

Option 3. Submission via NCBI's FTP server, using a predefined XML template

In addition to the web interface, NCBI provides an FTP-based solution to submit bulk metadata. The corresponding AIRR XML templates can be found under https://github.com/airr-community/airr-standards/tree/master/NCBI_ implementation/templates_XLS. Otherwise users should refer to the current SRA file upload manual https://www. ncbi.nlm.nih.gov/sra/docs/submitfiles/. Users planning to frequently submit AIRR-seq data to SRA using scripts to generate the XML files MUST ensure that the templates are identical to the current upstream version on Github.

Step 2. Processed MiAIRR data submission to GenBank/TLS

Processed sequence data will be submitted to the "Targeted Locus Study" (TLS) section of GenBank. The details of this submission process are currently still being finalized. Basically the procedure is identical to a conventional GenBank submission with the exception of additional keywords marking it as TLS submission.

Non-productive records should be removed before the data submission or use an alternative annotation as described in the specification document.

• Generating MiAIRR compliant GenBank/TLS submissions: https://changeo.readthedocs.io/en/stable/examples/genbank.html

GenBank provides multiple tools (GUI and command-line) to submit data:

- BankIt, a web-based submission tool with wizards to guide the submission process
- Sequin, NCBI's stand-alone submission tool with wizards to guide the submission process is available by FTP for use on for Windows, macOS and Unix platforms.
- Tbl2asn is the recommended tool for the bulk data submission. It is a command-line program that automates the creation of sequence records files (.sqn) for submission to GenBank, driven by multiple tabular unput data files. Documentation and download options can be found under https://www.ncbi.nlm.nih.gov/genbank/tbl2asn2/.

MiAIRR-to-NCBI Specification

Outline of INSDC reporting procedure

TODO: Outline the reporting procedure for data sets 1-4

In terms of standard compliance it is currently REQUIRED¹ to deposit information for MiAIRR data sets 5 and 6 in general-purpose sequence repositories for which an AIRR-accepted specification on information mapping MUST exist. However, users should note that in the future additional AIRR-sanctioned mechanisms for data deposition will become available as specified by the AIRR Common Repository Working Group. The mapping of data items in MiAIRR data sets 5 and 6 differs substantially in size and structure and therefore requires distinct reporting procedures:

- Set 5: This is free text information describing the work flow, tools and parameters of the sequence read processing. It is REQUIRED that this information is deposited as a freely available document, permanently linked via a DOI. Note that is currently neither a specific format for this document nor a recommended service provider for obtaining the DOI.
- Set 6: This is specified to contain the consensus sequence and the following information obtained from the initial analysis: V, D and J segment, C region and IMGT-JUNCTION² [LIGMDB_V12]. These will be deposited in a general-purpose INSDC repository, using the record structure described below.

¹ See the "Glossary" section on how to interpret term written in all-caps.

² Note that according to IMGT definition this is a superset of the CDR3.

INSDC records were originally designed to hold individual Sanger sequences. Therefore each record will contain a header with information largely identical between all records in an AIRR sequencing study. Records can be concatenated for uploading.

The INSDC feature table (FT) [INSDC_FT] is a sequence annotation standard used within the INSDC records and assigns information to specified positions on the reported sequence string. In regard to the correct location of the provided annotation, it should especially be noted that some V(D)J inference tools will return coordinates referring to the reference instead of the query sequence. As the sequence submitted in a record MUST be identical to the query sequence, the positions provided by the V(D)J inference tool MUST, if necessary, be translated back onto the query sequence. In case the start and/or end of a feature cannot be reliably determined or is not present in the reported sequence³, open intervals CAN be used for reporting. However, open intervals MUST NOT be used to deliberately obfuscate known positions.

In addition to the required information specified in *Table_1*, users CAN use all valid FT keys/qualifiers to provide further annotation for the reported sequences. However, a record MUST still be compliant with this specification, if such OPTIONAL information would be removed, meaning that it is FORBIDDEN to move REQUIRED information into OPTIONAL keys/qualifiers. In addition, users MUST NOT use keys/qualifiers that could create ambiguity with the keys/qualifiers specified here.

element	FT key	FT qualifier	FT value	REQUIRED (if used by original study)
V segment	V_segment	/gene	see [Feature table]	yes
D segment	D_segment	/gene	see [Feature table]	yes; if IGH, TRB or TRD sequence
J segment	J_segment	/gene	see [Feature table]	yes
C region	C_region	/gene	see [Feature table]	yes
JUNCTION	CDS	/function	"JUNCTION"	yes

Table 1: Summary of the mapping of mandatory AIRR MiniStd data set 6 elements to the INSDC feature table (FT). Note that the overall record will contain additional information, such as cross-references linking the deposited sequence reads and metadata.

Element mapping

The broad strategy of element mapping to the various repositories is depicted in *Table_2*.

MiAIRR data set / subset	target repository
1 / study	BioProject
1 / subject	
1 / diagnosis & treatment	
2 / sample	BioSample
3 / processing (cells)	
3 / processing (nucleic acids)	SRA
4 / raw sequences	
5 / processing (data)	user-defined DOI
6 / Processed sequences & annotations	Genbank

Table 2: Summary of the mapping of MiAIRR data sets to the various repositories

 $^{^{3}}$ This can occur e.g. in paired-end sequencing of head-to-head concatenated transcripts, where the 5' end of the V segment is present in the amplicon, but cannot be precisely determined.

Mapping of data sets 1-4 to BioProject/BioSample/SRA

TODO: Include item-by-item mapping [NCBI_NBK47528]

Mapping of data set 5 to a user-defined repository

While several mandatory item have been defined in this data set, there is currently no mapping as the reporting procedure is implemented as a free text document. AIRR RECOMMENDS to use Zenodo for deposition of these documents, as it is hosted by CERN and supports versioned DOIs (termed "concept" DOI). Users SHOULD use the existing AIRR tag when submitting documents to increase the visibility of their study.

Mapping of data set 6 to INSDC

Users should note that while the FT is standardized, the overall sequence record structure diverges between the three INSDC repositories. The following section refers to items at or above the hierarchy level of the FT using the GenBank specification [GENBANK_FF], the corresponding designations of ENA [ENA_MANUAL] are provided in parenthe-sis¹¹.

Record header

The header MUST contain all of the following elements:

- REQUIRED: header structure as specified by the respective INSDC repository [ENA_MANUAL] [GENBANK_FF] [GENBANK_SR].
- FORBIDDEN: The DEFINITION entry will be autopopulated by information provided in the FT part (misc_feature, /note).
- REQUIRED: identifier of the associated SRA record (MiAIRR data set 4) as DBLINK (ENA: DR line). Note that it is **not** possible to refer to individual raw reads, only the full SRA collections can be linked.
- REQUIRED: in the KEYWORDS field (ENA: KW line):
 - the term "TLS"
 - the term "Targeted Locus Study"
 - the term "AIRR"
 - the term "MiAIRR:<x>.<y>" with <x> and <y> indicating the used version and subversion of the MiAIRR standard.
- REQUIRED: DOI of the associated free-text record containing the information on data processing (MiAIRR data set 5) as REMARK within a REFERENCE⁴ (ENA: RX line).
- OPTIONAL: The use of structured comments is currently evaluated for use in future versions of the MiAIRR standard.

¹¹ Note that there is currently no submission specification for ENA. This information is provided for reference only and will be moved to a separate document in the future.

⁴ The current GenBank record specification does not include a separate key for DOIs.

Feature table

The feature table, indicated by FEATURES (ENA: RX line), MUST or SHOULD contain the following keys/qualifiers:

General sequence information

- REQUIRED: key source containing the following qualifiers:
 - REQUIRED: qualifier /organism (required by [INSDC_FT]).
 - REQUIRED: qualifier /mol_type (required by [INSDC_FT]).
 - REQUIRED: qualifier /citation pointing to the reference in the header (REFERENCE, ENA: RN line) that links to the data set 5 document.
 - REQUIRED: qualifier /rearranged⁵.
 - REQUIRED: qualifier /note containing the AIRR_READ_COUNT keyword to indicate the read number used for the consensus. The criteria for selecting these reads and the procedure used to build the consensus SHOULD be reported as part of data set 5.
 - OPTIONAL: qualifier /note containing the AIRR_INDEX_CELL keyword for single-cell experiments. The
 value of the keyword SHOULD only contain alpha-numeric characters and MUST be identical for sequences derived from the same cell of origin.
 - RECOMMENDED: qualifiers /assembly_gap and /linkage_evidence to annotate non-overlapping paired-end sequences.
 - RECOMMENDED: qualifier /strain, if /organism is "Mus musculus".

Note that additional qualifiers might be REQUIRED by GenBank to harmonize the GenBank record with the BioSample referenced by it in the header. A list of known BioSample keyword and GenBank qualifiers that MUST contain the same information can be found below. Whether (and in which direction) the existence of a keyword/qualifiers triggers a requirement in the corresponding record is currently unknown. Please report any undocumented requirements surfacing during submission to the MiAIRR team.

BioSample keyword	GenBank FT qualifier
cell type	/cell_type
isolate	/isolate
sex	/sex
tissue	/tissue_type

Segment and region annotation

The following keys MUST be used for annotation according to their FT definition, if the respective item has been reported by the original study:

• REQUIRED: key V_region. Note that this key MUST NOT be used to annotate V segment leader sequence⁶⁷.

⁵ Although FT does specify a /germline qualifier for non-rearranged sequences it has not been included in this specification as there is no obvious use case for it. In addition, non-rearranged transcripts would lack a number of other features that are assumed to be present, first of all the JUNCTION.

⁶ The FT explicitly states that $V_{segment}$ does **not** cover the leader sequence. The definition of V_{region} is slightly more ambiguous, however in combination with the $V_{segment}$ definition, it becomes clear that the leader is also not considered to be a part of V_{region} . Therefore the leader sequence should be implicitly annotated as the region between the start of *CDS* and the start of V_{region} .

⁷ Previously the leader was implicitly annotated as the region between *CDS* start and V_{region} start. As it was decided to drop the "global" CDS to make it easier to accommodate for INDELs, this is currently not an option anymore.

• REQUIRED: key misc_feature with coordinates identical to those given in V_region. This key MUST contain a /note qualifier that contains a string as value, which describes the general type of variable region described by the record. The string MUST match the regular expression

/^(immunoglobulin (heavy|light)|T cell receptor (alpha|beta|gamma|delta)) chain_ →variable region\$/

This string will be used as record heading upon import into Genbank. Note that while this behavior of Genbank is undocumented, the procedure has been approved by NCBI.

- REQUIRED: key V_segment, both coordinates MUST be within V_region. Note that this key MUST NOT be used to annotate V segment leader sequence?^{Page 53, 7}.
- REQUIRED: key D_segment, both coordinates MUST be within V_region. This key is only REQUIRED for sequences of applicable loci (*IGH*, *TRB*, *TRD*⁸). In the rare case of rearrangements using two D segments, this key SHOULD occur twice, but the coordinates of both keys MUST NOT overlap.
- REQUIRED: key J_segment, both coordinates MUST be within V_region.
- REQUIRED: key C_region, both coordinates MUST NOT overlap with V_region. If the region can be unambiguously identified, the respective official gene symbol MUST be reported using the /gene qualifier. If only the isotype (e.g. IgG) but not the subclass (e.g. IgG1) can be identified, a truncated gene symbol (e.g. IGHG instead of IGHG1) SHOULD be reported instead⁹.

Each [VDJ]_segment key MUST or SHOULD contain the following qualifiers:

- REQUIRED: qualifier /gene, containing the designation of the inferred segment, according to the database in the first /db_xref entry. This qualifier MUST NOT contain any allele information.
- RECOMMENDED: qualifier /allele, containing the designation of the inferred allele, according to the database in the first /db_xref entry. Note that while INSDC does not specify any format for this qualifier, AIRR compliance REQUIRES that this field only contains the allele string, i.e. without the gene name or separator characters.
- REQUIRED: qualifier /db_xref, linking to the reference record of the inferred segment in a germline database [INSDC_XREF]. This qualifier can be present multiple times, however only the first entry is mandatory and MUST link to the database used for the segment designation given with /gene and (if present) /allele.

Note on referencing IMGT databases: There are two IMGT database available in the controlled vocabulary [INSDC_XREF]:

- IMGT/GENE-DB: This is the genome database, which requires that a reference sequence has been mapped to genomic DNA. When using this database as reference, note that you can only refer to the gene symbol not the allele. In the case of ambiguous allele calls (see below) this means that you MUST NOT annotate any /allele at all. Nevertheless, this SHOULD be the default database for applications using IMGT as reference, as the sequence for each gene/allele is unique.
- IMGT/LIGM: This database collects sequences described in INSDC databases (GenBank/ENA/DDBJ). As
 it might contain multiple entries representing a given gene/allele, it is NOT RECOMMENDED to use it
 unless that inference gene/allele is only present in IMGT/LIGM and not in IMGT/GENE-DB.
- RECOMMENDED: /inference to indicate the tool used for segment inference. The description string SHOULD use COORDINATES as category and aligment as type [INSDC_FT].

Annotation of sequences producing multiple hits with identical scores is problematic and is ultimately at the discretion of the depositing researcher. However, the algorithms used for tie-breaking SHOULD be documented in data set 5. In addition, the following procedures MUST be followed:

⁸ For simplicity, this document only uses human gene symbols. For non-human species the specification pertains to the respective orthologs.

⁹ This approach has been approved by NCBI.

- Certain gene, ambiguous allele: If multiple alleles of the same gene match to the sequence, the /allele qualifier MUST NOT be used. As the REQUIRED /db_xref qualifier will ofter refer to a specific allele, all equal hits SHOULD be annoted via this qualifier (which can be use multiple times). Also see the note on the limitations of the IMGT/GENE-DB reference database above.
- Ambiguous gene: Pick one, annotate using the qualifiers as noted for ambiguous allele.

JUNCTION annotation

INSDC does currently not define a key to annotate JUNCTION¹⁰. Therefore the following procedure MUST be used:

- REQUIRED: key CDS, indicating the positions of
 - 1. the first bp of the first AA of JUNCTION
 - 2. the last bp of the last AA of JUNCTION as determined by the utilized V(D)J inference tool.

Open coordinates MUST be used for both coordinates to allow for automated creation of the /translated qualifier providing the peptide sequence. Further note that a non-productive JUNCTION can have a length not divisible by three. This key contains the following qualifiers:

- REQUIRED: qualifier /codon_start with the assigned value "1".
- REQUIRED: qualifier / function with the assigned value "JUNCTION".
- REQUIRED: qualifier /product with an assigned value matching the regular expression

The variable region referred to in the string MUST be the same as the one given in the misc_feature key.

- RECOMMENDED: qualifier /inference, indicating the tool used for positional inference. The description string SHOULD use COORDINATES as category and protein motif as type [INSDC_FT].
- FORBIDDEN: qualifier /translated, which will be automatically added by Genbank.

Note that the complete CDS key will be removed by Genbank if the translation contains stop codons or to many "N" (exact number unknown). As such a record will lack a central piece of REQUIRED information it is REC-OMMENDED that submitters either

- remove the complete record or
- replace the CDS with a misc_feature key while at the same time removing the /codon_start and / product qualifiers

upfront, as described in the submission manual. If the submitter chooses the replacement option, it has to be ensured that the annotated coordinates are actually valid and not affect by the frame- shift.

¹⁰ NCBI confirmed that once there would be enough datasets using the *JUNCTION* tag as specified here, a motion for an INSDC-sanctioned key could be initiated.

Record body

The record body starts after ORIGIN (ENA: SQ line) and MUST contain:

• the consensus sequence

Glossary

- MUST / REQUIRED: Indicates that an element or action is necessary to conform to the standard.
- SHOULD / RECOMMENDED: Indicates that an element or action is considered to be best practice by AIRR, but not necessary to conform to the standard.
- CAN / OPTIONAL: Indicates that it is at the discretion of the user to use an element or perform an action.
- MUST NOT / FORBIDDEN: Indicates that an element or action will be in conflict with the standard.

Abbreviations

- AA: amino acid
- bp: base pair
- DOI: digital object identifier
- FT: INSDC Feature Table
- INSDC: International Nucleotide Sequence Database Collaboration

• SRA: sequence read archive

Introduction

The MiAIRR standard

The MiAIRR standard (minimal information about adaptive immune receptor repertoires) is a minimal reporting standard for experiments using sequencing-based technologies to study adaptive immune receptors (e.g. T cell receptors or immunoglobulins). It is developed and maintained by the Minimal Standards Working Group of the Adaptive Immune Receptors Repertoire (AIRR) Community [Breden_2017]. The current version (1.0) of the standard has been recently published [Rubelt_2017] and was passed by the general assembly at the annual AIRR Community meeting in December 2017. MiAIRR requires researchers to report six sets of information:

- 1. study, subject, diagnosis & intervention
- 2. sample collection
- 3. sample processing and sequencing
- 4. raw sequencing data
- 5. data processing
- 6. processed sequences with a basic analysis results

However, MiAIRR only describes the mandatory data items that have to be reported, but neither provides details how and where to deposit data nor specifies data types and formats. Therefore this document aims to provide both a submission manual for users as well as a detailed data specification for developers.

Requirement Levels of AIRR Schema Fields

Clarification of Terms

- The terms "MUST", "MUST NOT", "REQUIRED", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY" and "OPTIONAL" are to be interpreted as described in [RFC2119].
- The terms "IF" and "ONLY IF" are are to be interpreted as sufficent and necessary requirement, respectively.
- The term "NULL-LIKE" is an extension of the NULL term in SQL and its equivalents in other programming languages, referring to the absence of data in a field (i.e., the field is empty). NULL-LIKE **additionally** includes the following terms, which also define the reason why the information is missing. As these terms are expected to be provided as text, the field would not be NULL but nevertheless NULL-LIKE (i.e., it lacks biologically interpretable information).
 - not_applicable: There is no meaningful value for this field due to study design (e.g., sex for a phage library).
 - not_collected: Data for this field was not collected during the study.
 - missing: Data for field was collected, but is not available now.

Categories of AIRR Schema Fields

- Fields MUST be indicated by the x-airr:miairr property IF and ONLY IF the field or its content is governed by the MiAIRR data standard [Rubelt_2017].
- The x-airr:miairr property MUST be assigned to one of the following three requirement levels:
 - essential: Information on this field MUST be provided and is considered critical for the meaningful interpretation of the data. Therefore the value of such a field MUST NOT be NULL-LIKE. Due to this strict requirement, this level is only assigned to a small set of fields. Importantly, fields are **not** elevated to this level based on the fact that the respective information should typically be available to the data generator. This was decided to simplify MiAIRR-compliant data annotation by third parties, who might perform this task based on publicly available information only.
 - important: Information for this field MUST be provided. However, the field MAY be assigned a NULL-LIKE value if the respective information is not available. The majority of fields governed by the MiAIRR data standard are assigned to this level.
 - defined: Information for this field MAY be provided. However, IF information matching the semantic definition of the field is provided, this field MUST be used for reporting.

Compliance with the MiAIRR Data Standard

- Compliance to the MiAIRR Data Standard is currently a binary state, i.e., a data either is or is not compliant, there are not "grades" of compliance. However, additional requirements for specific use cases might be defined in the future.
- Data sets are considered MiAIRR-compliant ONLY IF all essential and important fields are reported.
- Note that important fields with NULL-LIKE values MUST NOT be dropped from a data set.
- Implementors of data entry interfaces SHOULD NOT set the default value of important fields to NULL-LIKE values, i.e., users should be required to actively select the values.

Metadata Annotation Guidelines

Purpose of this Document

This document describes the RECOMMENDED ways to provide metadata annotation for various experimental setups.

Clarification of Terms

• The key words "MUST", "MUST NOT", "REQUIRED", "SHOULD", "SHOULD NOT", "RECOM-MENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].

Individual fields

library_generation_method

The library_generation_method describes how the nucleic acid annotated in template_class that encodes the V(D)J-rearrangement it reverse-transcribed, amplified and/or otherwise prepared for further processing. Typically this procedure will precede further NGS platform- specific steps, however these procedures MAY be combined. The field uses a controlled vocabulary, the individual values are described below:

template_	c lābs ary_generat	i Methedold gy					
DNA	PCR	Conventional PCR on genomic DNA of a vertebrate host (requires: synthetic					
		== false)					
		Conventional PCR on DNA of a synthetic library (requires: synthetic == true					
)					
RNA	RT(RHP)+PCR	RT-PCR using random hexamer primers					
		RRT-PCR using oligo-dT primers					
	RT(oligo-dT)+TS	+ BCR ACE PCR (i.e. RT is followed by a template switch (TS) step) using oligo-dT					
		primers					
	RT(oligo-dT)+TS	(UMP) APCERPCR using oligo-dT primers and template switch primers containing					
		unique molecular identifiers (UMI), i.e., the 5' end is UMI-coded					
		RT-PCR using transcript-specific primers					
		SCRACE PCR using transcript- specific primers					
	RT(specific)+TS	(UMR)APERPCR using transcript- specific primers and template switch primers					
		containing UMIs					
	RT(specific+UMI) FFER CR using transcript-specific primers containing UMIs (i.e., the 3' end is					
		UMI-coded)					
	RT(specific+UMI) 5TSRACE PCR using transcript- specific primers containing UMIs (i.e., the 3'					
		end is UMI-coded)					
	RT(specific)+TS	RT-based generation of dsDNA without subsequent PCR. This is used by RNA-					
		seq kits.					
any	other	Any methodology not covered above					

*_pcr_primer_target_location

The fields forward_pcr_primer_target_location and reverse_pcr_primer_target_location describe the location of the innermost primer used for a given locus. This information is critical to determine which positions of a sequence reflect a biological process and which are an artifact of the experiment.

The terms "proximal" and "distal" in the field description refer to the start of the respective V or C gene. Using human *TRAC* and a hypothetical primer as an example:

1	5	10	15	20	25	30	35	40	45	50	55	60	position (+1 = start of
\hookrightarrow	exon	1)											
1.													
				TGC	CGTGT	ACCAG	CTGAG	AG					TRAC primer (reverse
\hookrightarrow	compl	ement))										
AT	ATCCA	GAACCO	TGAC	CCTGC	CGTGT	ACCAG	CTGAG	AGACT	CTAAA	TCCAG	ſGACA	AGT	Chr. 14:22,547,506-22,547,
\hookrightarrow	565 (GRCh38	3)										
				^ ^				^					
			[4	a][b]				[c]					markers

In this case:

- +19 (marker [a]) is the most distal untemplated nucleotide
- +20 (marker [b]) is the most proximal templated nucleotide
- +39 (marker [c]) is the most distal templated nucleotide

cell_subset

The cell_subset field is ontology-controlled, i.e., if present, it MUST refer to a Cell Ontology (CL) term via its id field. The field SHOULD NOT be used for values other than lymphocyte (CL:0000542) and its descendents. The reasoning behind this is that rearrangements of IG and TR loci are typically confined to this population, so that other nodes, do not provide further information. In addition, the field SHOULD only be used if the subset has been purified to a level that is comparable to flow cytometric cell sorting.

- In general, the provided annotation MUST NOT contradict the experimentally determined phenotype. E.g., if the experiment shows that the population is CD27+ a term that is explicitly defined in CL as CD27- MUST NOT be used.
- However, this does not mean that all markers listed in the description of an ontology term need to be confirmed, as long as the existing information is considered sufficient for classification and not contradictory (see above).
- In case the experimentally isolated cells to not match any "leaf" term, e.g., due to the isolation of multiple populations that contradict the definitions, the general advice is to move up the CL hierarchy to the most distal term that is no-contradictory. In this case, cell_phenotype should be used to define the markers that were used experimentally.
- Note that ontology-controlled fields allow exactly one term. Therefore, mixtures of defined cell populations either need to be demultiplexed, or if this is not possible use the last (i.e., most distal) common term of all cell populations involved. Again, cell_phenotype can be used to provide the markers used in the experiment.

Specific Use Cases and Experimental Setups

Peripheral Blood Mononuclear Cells (PBMCs)

PBMCs are frequently used starting material for AIRR-seq studies in humans and are prepared by a density-gradient centrifugation using Ficoll. As they constitute a mixture of myeloid and lymphoid cells, the following points should be taken into consideration when annotating experiments using PBMCs:

- The cell_population and cell_phenotype fields should be NULL as PBMCs are neither sufficiently pure nor do they exclusively contain cells of the lymphocytic lineage (see *cell_subset*).
- Note that while Cell Ontology does provide a term peripheral blood mononuclear cell (CL:2000001), this is a sister node of lymphocyte (CL:0000542) and therefore outside of the current specification.
- The typical annotation for PBMC is therefore as follows:

```
sample_type:"peripheral venous puncture"
tissue:
    label:"venous blood"
    id:"UBERON:0013756"
tissue_processing"Ficoll gradient"
cell_subset:NULL
cell_phenotype:NULL
```

Synthetic libraries

In synthetic libraries (e.g., phage or yeast display), particles present genetically engineered constructs (e.g., scFv fusion receptors) on their surface. As this deviates substantially from other workflows, the following annotation SHOULD/MUST be used:

- In general, Subject should be interpreted as the initial library that undergoes a mutation/selection procedure.
- synthetic: MUST be set to true
- species: It is assumed that every synthetic library is derived from V and J genes that exist in some vertebrate species. This field SHOULD encode that species. Importantly, it MUST NOT encode the phage vector, the bacterial host or a comparable biological component of the library system that constitutes the presenting particle.
- sample_type: SHOULD be NULL.
- single_cell: Only true if individual particles are isolated and sequenced. Note that colonies or plaques, even if containing genetically identical particles, *per se* do not match this definition and therefore MUST be annotated as false.
- cell_storage: SHOULD be used for non-cellular particles analogously.
- physical_linkage: For scFv constructs the hetero_prelinkeded term MUST be used. VHH (i.e., camelid) libraries SHOULD annotate none as there is only a single rearrangement envolved.

10X Chromium

The current 10X V(D)J Kits (07/2020, Rev. G) perform a fully nested PCR, in which only the reverse primers (i.e., complementary to the constant region) are Ig/TCR specific, while the forward primers anneal to the sequence of the template switch primer. For the purpose of annotation, this is considered a gene-specific amplification, therefore such experiments SHOULD be annotated as follows:

- single_cell: MUST be true
- library_generation_method: SHOULD be RT(specific)+TS(UMI)+PCR
- pcr_target MAY contain multiple entries, one for each locus that is potentially amplified. Within each entry (i.e., each PCRTarget object) the following annotations SHOULD be provided:
 - pcr_target_locus: The locus described by this object, using the controlled vocabulary defined in the AIRR schema. Note that each object can only describe one locus, multiple loci require multiple PCRTarget objects.
 - forward_pcr_primer_target_location: NULL (as it cannot be reliably determined.
 - reverse_pcr_primer_target_location: Locus and position according to the respective set of reverse primers.

2.3.2 AIRR Data Representations

AIRR Data Representations are versioned specifications that consist of a file format and a well-defined schema. The schema is provided in a machine-readable YAML document that follows the OpenAPI v2.0 specification. The schema defines the data model, field names, data types, and encodings for AIRR standard objects. Strict typing enables interoperability and data sharing between different AIRR-seq analysis tools and repositories, and some fields use a controlled vocabulary or an ontology for value restriction. Specification extensions are utilized to define AIRR-specific attributes.

FAIR Principles

We desire AIRR standard objects to be FAIR (findable, accessible, interoperable and reusable) [Wilkinson_2016]:

- findable: by giving AIRR standard objects a globally unique identifier
- accessible: by providing an API where AIRR standard objects can be queried and downloaded
- interoperable: by defining a OpenAPI schema for the AIRR standard objects
- reusable: by linking the AIRR standard objects together into a standard formats

AIRR Data Model

The MiAIRR standard defines the minimal information for submission and publication of AIRR-seq datasets. The standard defines a set of data elements for this information and organizes them into six high-level sets.

- Study, Subject and Diagnosis
- Sample Collection
- Sample Processing and Sequencing
- Raw Sequences
- Data Processing
- Processed Sequences with Annotations

However beyond these sets, MiAIRR does not define any structure, data model or relationship between the data elements. This provides flexibility for the information to be stored in various database repositories but is problematic for interoperability and reusability of that information by computer programs. The AIRR Data Model overcomes these issues by defining a schema for the MiAIRR data elements, structuring them within schema objects, defining the relationship between those objects, and defining a file format.

Here are the primary schema objects of the AIRR Data Model:

Schema	Description
Object	Description
Study	Information about the experimental study design, including the title of the study, laboratory contact
Study	information, funding, and linked publications.
Subject	Information, running, and mixed publications. Information about the study cohorts and individual subjects, including species, sex, age, and ancestry.
	s Information about the study conorts and marviaua subjects, including species, sex, age, and ancest y.
Sample	Information about the origin and expected composition of the biological sample(s). This set aims to
Sampre	capture essential information about the collection of a sample, including its source (e.g., anatomical
	site), its provenance (provider), and the experimental condition (e.g., the time point during the course
	of a disease or treatment).
CallDrag	
CellProc	e stationg ation about the cell subset being profiled, as defined by the investigator, and the flow cytometry or
	other markers used to select the subset. Additional information includes the number of cells per sample
	and whether cells were prepared in bulk or captured as single cells.
NucleicA	c IddPronaeisssiate put nucleic acid sample type (e.g., RNA versus DNA) and how immune-receptor gene
	rearrangements were amplified and sequenced (for example, RACE-PCR versus multiplex PCR, paired
<u> </u>	PCR, and/or varying read length and sequencing chemistries).
Sequenci	ngRimmation about the sequencing run, such as the number of reads, read lengths, quality control pa-
	rameters, the sequencing kit and instrument(s) used, and run batch number. Also includes information
	about the raw data for the sequencing run (e.g., FASTQ files).
	essigning ation about the data processing to transform the raw sequencing data into Rearrangements.
Repertoi	$r \varepsilon$ omposite object that combines the schema objects Study, Subject, Diagnosis, Sample,
	CellProcessing, NucleicAcidProcessing, SequencingRun, and DataProcessing. Each
	Repertoire has a unique identifier repertoire_id for linking with other data files, e.g.
	Rearrangements. Repertoires have their own schema and file format described <i>here</i> .
Rearrang	memory tated sequences describing adaptive immune receptor chains. Rearrangements have their own
	schema and file format described <i>here</i> .
Clones	Information about inferred clones from a study. Clones have their own schema and file format described
	here.
Cells	Information about an observed Cell in a study. Cells have their own schema and file format described
	here.
	ession about expression properties observed for a specific cell. CellExpression properties have
	escheir own schema and file format described <i>here</i> .
Receptor	Information about adaptive immune receptors (i.e., Ig and TCR) that are linked to observed Cells in a
	study. Receptors have their own schema and file format described here.
Germline	SEtsts the receptor germline sequences that have been identified for a single locus within a par-
	ticular species or sub-species, together with supporting evidence and additional metadata to as-
	sist with sequence annotation. Brings together the subsidiary objects AlleleDescription,
	${\tt SequenceDelineationV, RearrangedSequence, UnrearrangedSequence, Acknowledgement.}$
Genotype	SEtsts the receptor germline sequences that have been identified within a single subject, including both
	those that are listed within GermlineSets and those that have not been so listed. References the sub-
	sidiary object Genotype, which covers a single locus.

Relationship between Schema Objects

The MiAIRR categories are hierarchical, and includes information about the study, the subjects, the collected samples and how they are processed, details of the sequencing protocol, and information about the data analysis. The top-down relationships are either 1-to-n indicating the top level object can be related to any number of sub-level objects, or n-to-n indicating any number of top level object can be related to any number of sub-level objects. Lastly, 1-to-1 indicates the top level object is related to a single sub-level object.

- Study 1-to-n with Subject. A study may contain any number of subjects.
- Subject 1-to-n with Diagnosis. Each subject may contain any number of diagnoses.
- Subject 1-to-n with Sample. Each subject may contain any number of samples.
- Sample 1-to-n with CellProcessing. A sample may have any number of cell processing records.
- CellProcessing 1-to-n with NucleicAcidProcessing. A cell processing record may have any number of nucleic acid processing records.
- NucleicAcidProcessing 1-to-n with SequencingRun. A nucleic acid processing records may have any number of sequencing runs.
- SequencingRun n-to-n with DataProcessing. Multiple sequencing runs can be combined in a data processing, and multiple data processing can be done on a sequencing run.

However, this hierarchy is deep and complicated. Therefore to simplify the processing of this information, we denormalized the hierarchy around the conceptual Repertoire object. This denormalization represents many relationships as 1-to-1 which simplifies the structure. A single Repertoire has these relationships with the primary schema objects.

- Repertoire 1-to-1 with Study. A repertoire is for a single study, though a study may have multiple repertoires.
- Repertoire 1-to-1 with Subject. A repertoire is for a single subject, though a subject may have other repertoires defined.
- SampleProcessing 1-to-1 with Sample, CellProcessing, NucleicAcidProcessing, and SequencingRun. A sample processing is a single chain from initial collection, through cell and nucleic acid processing, to sequencing.
- Repertoire 1-to-n with SampleProcessing. Generally a repertoire has a single sample processing, but sometimes studies perform technical replicates or re-sequencing to generate additional data, and these studies will have multiple sample processings, which are to be combined and analyzed together as part of the same repertoire.
- Repertoire 1-to-n with DataProcessing. A repertoire can be analyzed multiple times. More details about multiple data processing is provided below.

The trade-off with denormalization of the hierarchy is that it causes duplication of data. For example, two repertoires for the same study will have the Study information duplicated within each of the two repertoire records; likewise multiple repertoires for the same subject will have the Subject information duplicated.

While the denormalized Repertoire simplifies read-only access to the MiAIRR information, it complicates data entry and write access to the information because updates need to be propagated to all of the duplicate records. Therefore, Repertoire was designed to be easily transformed into a normalized form, representing the full hierarchy of the objects, by utilizing the study_id, subject_id, sample_id, and sample_processing_id fields to uniquely identify the Study, Subject, Sample, and SampleProcessing objects across multiple repertoires. The exception is that CellProcessing and NucleicAcidProcessing do not have their own unique identifiers, so they are included within SampleProcessing.

AIRR extension properties

The OpenAPI V2 and V3 specification provides the ability to define extension properties on schema objects. These are additional properties on the schema definition directly, not to be confused with additional properties on the data. These extension properties allow those schema definitions to be annotated with MiAIRR and AIRR specific information. Instead of creating separate extensions for each property, a single extension x-airr property is defined, which is an object that contains any number of properties. Within the AIRR schema, AIRR_Extension defines the schema for the x-airr object and the properties within it. Here is a list of the currently supported AIRR extension properties:

Extension	Description							
miairr	Present if the annotated property is a MiAIRR data standard element. Always has a <i>requirement</i>							
	<i>level</i> assigned to it.							
nullable	Assumes miairr. False if the annotated property must not be NULL by the MiAIRR standard, oth-							
	erwise True or null. This extension is not valid for OpenAPI V3 as the nullable builtin prop							
	should be used.							
set	Assumes miairr. The MiAIRR set for the annotated property.							
subset	Assumes miairr. The MiAIRR subset for the annotated property.							
name	Assumes miairr. The MiAIRR field name.							
format	Describes the format for the annotated property. Value is either free text, controlled							
	vocabulary or ontology.							
ontology	If format=ontology then this provides additional information about the ontology including draft							
	status, name, URL and top node term.							
identifier	True if the field is an identifier required to link metadata and/or individual sequence records across							
	objects in the complete AIRR Data Model and ADC API.							
adc-query-su	uppose tif an ADC API implementation must support queries on the field. If false, query support for							
	the field in ADC API implementations is optional.							
deprecated	True if the field has been deprecated from the schema.							
deprecated-defactoring the deprecation of the field.								
deprecated-	replaced epireby ted field is replaced by this list of fields.							

Schema Definitions

Repertoire Schema

A Repertoire is an abstract organizational unit of analysis that is defined by the researcher and consists of study metadata, subject metadata, sample metadata, cell processing metadata, nucleic acid processing metadata, sequencing run metadata, a set of raw sequence files, data processing metadata, and a set of Rearrangements. A Repertoire gathers all of this information together into a composite object, which can be easily accessed by computer programs for data entry, analysis and visualization.

A Repertoire is specific to a single subject otherwise it can consist of any number of samples (which can be processed in different ways), any number of raw sequence files, and any number of rearrangements. It can also consist of any number of data processing metadata objects that describe the processing of raw sequence files into Rearrangements.

Typically, a **Repertoire** corresponds to the biological concept of the immune repertoire for that single subject which the researcher experimentally measures and computationally analyzes. However, researchers can have different interpretations about what constitutes the biological immune repertoire; therefore, the **Repertoire** schema attempts to be flexible and broadly useful for all AIRR-seq studies.

Another researcher can take the same raw sequencing data and associated metadata and create their own Repertoire that is different from the original researcher's. A common example is to define a repertoire that is a subset such as "productive rearrangements for IGHV4" whereas the original researcher defined a more generic "B cell repertoire". This new Repertoire would have much of the same metadata as the original Repertoire, except associated with a

different study, and with additional information in the data processing metadata that describes how the rearrangements were filtered down to just the "productive rearrangements for IGHV4". Likewise, another researcher may get access to the original biosample material and perform their own sample processing and sequencing, which also would be a new Repertoire. That new Repertoire could combine samples from the original researcher's Repertoire with the new sample data as a large dataset for the subject.

Multiple Data Processing on a Repertoire

Data processing can be a complicated multi-stage process. Documenting the process in a formal way is challenging because of the diversity of actions that may be performed. The MiAIRR standard requires documentation of the process but in an informal way with free text descriptions. A Repertoire might undergo multiple different data processing for any number of reasons, e.g. to compare the results from different toolchains, or to compare different settings for the same toolchain.

It is expected that all of the Samples of a Repertoire will be processed together within a DataProcessing. That is, a DataProcessing that only uses some but not all samples in a Repertoire could be confusing to users and appear as though data is missing. Likewise, processing some samples within a Repertoire with one DataProcessing and the remaining samples with a different DataProcessing could also confuse users. Because DataProcessing is unstructured information, it is not possible to validate that all Samples in a Repertoire are being processed together, so this expectation cannot be strictly enforced.

Having multiple DataProcessing for a Repertoire will create multiple sets of Rearrangements that are distinct and separate from each other. Analysis tools need to be careful not to mix these sets of Rearrangements from different DataProcessing because it can generate incorrect results. The identifier data_processing_id was added so Rearrangements can identify their specific DataProcessing.

Linking Data

Each Repertoire has a unique repertoire_id identifier. This identifier should be globally unique so that repertoires from multiple studies can be combined together without conflict. The repertoire_id is used to link other AIRR data to a Repertoire. Specifically, the *Rearrangements Schema* includes repertoire_id for referencing the specific Repertoire for that Rearrangement.

If a Repertoire has multiple DataProcessing then data_processing_id should be used to distinguish the appropriate DataProcessing within the Repertoire. The Rearrangements contains data_processing_id for this purpose. The data_processing_id is only unique within a Repertoire so repertoire_id should first be used to get the appropriate Repertoire object and then data_processing_id used to acquire the appropriate DataProcessing.

It is expected that typical Repertoires might only have a single DataProcessing, in which case repertoire_id and data_processing_id will be semantically equivalent and only the former should be used.

If a Repertoire has multiple sample processing objects in the sample array then sample_processing_id should be used to distinguish the the appropriate sample processing object within the Repertoire. The Rearrangement object can contain a sample_processing_id to uniquely identify a sample processing object within a Repertoire. Like data_processing_id, the sample_processing_id is only unique within the Repertoire so repertoire_id should first be used to get the appropriate Repertoire object and then sample_processing_id should be used to determine the appropriate sample processing object that is associated with the Rearrangement. If the Rearrangement object does not have a sample_processing_id then it can be assumed that the rearrangement is associated with all of the samples in the Repertoire (e.g. the rearrangement is a collapsed rearrangement across multiple samples).

It is expected that **Repertoires** might often have a single sample processing object, in which case **repertoire_id** and **sample_processing_id** will be semantically equivalent and only the former should be used.

Finally, if it is necessary to link a Rearrangement object with a unique pairing of sample processing and DataProcessing, the repertoire_id of the Rearrangement object should be used to identify the correct

Repertoire object and then the data_processing_id should be used to identify the correct DataProcessing metadata and the sample_processing_id should be used to identify the correct sample processing metadata within that Repertoire.

Duality between Repertoires and Rearrangements

There is an important duality relationship between Repertoires and Rearrangements, specifically with the experimental protocols described in the Repertoire versus the annotations on Rearrangements. A Repertoire defines an experimental design for what a researcher intends to measure or observe, while the Rearrangements are what was actually measured and observed. Technically, the border between the two occurs at sequencing, that is when the biological physical entity (prepared DNA) is measured and recorded as information (nucleotide sequence).

This duality is important when considering how to answer certain questions. For example, locus for Rearrangements may have the value "IGH" which indicates that B cell heavy chain receptors were measured, yet the Repertoire might have "T cell" in cell_subset which indicates the researcher intended to measure T cells. This conflict between the two indicates something is wrong. Differences can occur in many ways, as with errors in the experimental protocol, or data processing might have incorrectly processed the raw sequencing data leading to invalid annotations.

File Format Specification

Files are YAML/JSON with a structure defined below. Files should be encoded as UTF-8. Identifiers are case-sensitive. Files should have the extension .yaml, .yml, or .json.

File Structure

- The file as a whole is considered a dictionary (key/value pair) structure with the keys Info and Repertoire.
- The file can (optionally) contain an Info object, at the beginning of the file, based upon the Info schema in the OpenAPI V2 specification. If provided, version in Info should reference the version of the AIRR schema for the file.
- The file should correspond to a list of Repertoire objects, using Repertoire as the key to the list.
- Each Repertoire object should contain a top-level key/value pair for repertoire_id that uniquely identifies the repertoire.
- Some fields require the use of a particular ontology or controlled vocabulary.
- The structure is the same regardless of whether the data is stored in a file or a data repository. For example, The *ADC API* will return a properly structured JSON object that can be saved to a file and used directly without modification.

Repertoire Fields

Download as TSV

Name	Туре	Attributes	Definition
repertoire_id	string	optional, iden-	Identifier for the repertoire object. This identifier should
		tifier, nullable	be globally unique so that repertoires from multiple stud-
			ies can be combined together without conflict. The
			repertoire_id is used to link other AIRR data to a Reper-
			toire. Specifically, the Rearrangements Schema includes
			repertoire_id for referencing the specific Repertoire for
			that Rearrangement.
repertoire_name	string	optional, nul-	Short generic display name for the repertoire
		lable	
repertoire_descripsting		optional, nul-	Generic repertoire description
		lable	
study	Study	required	Study object
subject	Subject	required	Subject object
sample	array of Sam-	required	List of Sample Processing objects
	pleProcessing		
data_processing	array of Dat-	required	List of Data Processing objects
	aProcessing		

Study Fields

Name	Туре	Attributes	Definition
study_id	string	required, nul- lable	Unique ID assigned by study registry such as one of the International Nucleotide Sequence Database Collabora- tion (INSDC) repositories.
study_title	string	required, nul- lable	Descriptive study title
study_type	Ontology	required, nul- lable	Type of study design
study_descriptior	string	optional, nul- lable	Generic study description
inclusion_exclusi	o strimg iteria	required, nul- lable	List of criteria for inclusion/exclusion for the study
grants	string	required, nul- lable	Funding agencies and grant numbers
study_contact	string	optional, nul- lable	Full contact information of the contact persons for this study This should include an e-mail address and a per- sistent identifier such as an ORCID ID.
collected_by	string	required, nul- lable	Full contact information of the data collector, i.e. the person who is legally responsible for data collection and release. This should include an e-mail address and a per- sistent identifier such as an ORCID ID.
lab_name	string	required, nul- lable	Department of data collector
lab_address	string	required, nul- lable	Institution and institutional address of data collector
submitted_by	string	required, nul- lable	Full contact information of the data depositor, i.e., the person submitting the data to a repository. This should include an e-mail address and a persistent identifier such as an ORCID ID. This is supposed to be a short-lived and technical role until the submission is relased.
pub_ids	string	required, nul- lable	Publications describing the rationale and/or outcome of the study. Where ever possible, a persistent identifier should be used such as a DOI or a Pubmed ID
keywords_study	array of string	required, nul- lable	Keywords describing properties of one or more data sets in a study
adc_publish_date	string	optional, nul- lable	Date the study was first published in the AIRR Data Commons.
adc_update_date	string	optional, nul- lable	Date the study data was updated in the AIRR Data Com- mons.

Subject Fields

Name	Туре	Attributes	Definition
subject_id	string	required, nul- lable	Subject ID assigned by submitter, unique within study. If possible, a persistent subject ID linked to an INSDC or similar repository study should be used.
synthetic	boolean	required	TRUE for libraries in which the diversity has been syn- thetically generated (e.g. phage display)
species	Ontology	required	Binomial designation of subject's species
organism	Ontology	DEPRE- CATED	Binomial designation of subject's species
sex	string	required, nul- lable	Biological sex of subject
age_min	number	required, nul- lable	Specific age or lower boundary of age range.
age_max	number	required, nul- lable	Upper boundary of age range or equal to age_min for specific age. This field should only be null if age_min is null.
age_unit	Ontology	required, nul- lable	Unit of age range
age_event	string	required, nul- lable	Event in the study schedule to which <i>Age</i> refers. For NCBI BioSample this MUST be <i>sampling</i> . For other implementations submitters need to be aware that there is currently no mechanism to encode to potential delta between <i>Age event</i> and <i>Sample collection time</i> , hence the chosen events should be in temporal proximity.
age	string	DEPRE- CATED	
ancestry_populat:	i o st ring	required, nul- lable	Broad geographic origin of ancestry (continent)
ethnicity	string	required, nul- lable	Ethnic group of subject (defined as cultural/language- based membership)
race	string	required, nul- lable	Racial group of subject (as defined by NIH)
strain_name	string	required, nul- lable	Non-human designation of the strain or breed of animal used
linked_subjects	string	required, nul- lable	Subject ID to which <i>Relation type</i> refers
link_type	string	required, nul- lable	Relation between subject and <i>linked_subjects</i> , can be genetic or environmental (e.g.exposure)
diagnosis	array of Diag- nosis	optional	Diagnosis information for subject
genotype	object	optional, nul- lable	Genotype for this subject, if known

Diagnosis Fields

Download as TSV

Name	Туре	Attributes	Definition
study_group_descr	işttüngen	required, nul-	Designation of study arm to which the subject is as-
		lable	signed to
disease_diagnosis	Ontology	required, nul-	Diagnosis of subject
		lable	
disease_length	string	required, nul-	Time duration between initial diagnosis and current in-
		lable	tervention
disease_stage	string	required, nul-	Stage of disease at current intervention
		lable	
prior_therapies	string	required, nul-	List of all relevant previous therapies applied to subject
		lable	for treatment of Diagnosis
immunogen	string	required, nul-	Antigen, vaccine or drug applied to subject at this inter-
		lable	vention
intervention	string	required, nul-	Description of intervention
		lable	
medical_history	string	required, nul-	Medical history of subject that is relevant to assess the
		lable	course of disease and/or treatment

Sample Fields

Name	Туре	Attributes	Definition
sample_id	string	required, nul-	Sample ID assigned by submitter, unique within study.
		lable	If possible, a persistent sample ID linked to INSDC or
			similar repository study should be used.
sample_type	string	required, nul-	The way the sample was obtained, e.g. fine-needle aspi-
		lable	rate, organ harvest, peripheral venous puncture
tissue	Ontology	required, nul-	The actual tissue sampled, e.g. lymph node, liver, pe-
		lable	ripheral blood
anatomic_site	string	required, nul-	The anatomic location of the tissue, e.g. Inguinal, femur
		lable	
disease_state_sam	ıpsteing	required, nul-	Histopathologic evaluation of the sample
		lable	
collection_time_p	oninnthbeelative	required, nul-	Time point at which sample was taken, relative to Col-
		lable	lection time event
collection_time_p	oûnto_belative	unquitired, nul-	Unit of Sample collection time
		lable	
collection_time_p	ositningreferenc	e required, nul-	Event in the study schedule to which Sample collection
		lable	time relates to
biomaterial_provi	dstring	required, nul-	Name and address of the entity providing the sample
		lable	

Tissue and Cell Processing Fields

Download as TSV

Name	Туре	Attributes	Definition
tissue_processing	string	required, nul-	Enzymatic digestion and/or physical methods used to
		lable	isolate cells from sample
cell_subset	Ontology	required, nul- lable	Commonly-used designation of isolated cell population
cell_phenotype	string	required, nul-	List of cellular markers and their expression levels used
	C	lable	to isolate the cell population
cell_species	Ontology	optional, nul-	Binomial designation of the species from which the an-
		lable	alyzed cells originate. Typically, this value should be
			identical to <i>species</i> , in which case it SHOULD NOT be
			set explicitly. However, there are valid experimental se-
			tups in which the two might differ, e.g., chimeric animal
			models. If set, this key will overwrite the <i>species</i> infor-
			mation for all lower layers of the schema.
single_cell	boolean	required, nul-	TRUE if single cells were isolated into separate com-
	_	lable	partments
cell_number	integer	required, nul- lable	Total number of cells that went into the experiment
cells_per_reaction	ninteger	required, nul-	Number of cells for each biological replicate
		lable	
cell_storage	boolean	required, nul-	TRUE if cells were cryo-preserved between isolation
		lable	and further processing
cell_quality	string	required, nul-	Relative amount of viable cells after preparation and (if
		lable	applicable) thawing
cell_isolation	string	required, nul-	Description of the procedure used for marker-based iso-
		lable	lation or enrich cells
cell_processing_p	rsttingol	required, nul-	Description of the methods applied to the sample includ-
		lable	ing cell preparation/ isolation/enrichment and nucleic
			acid extraction. This should closely mirror the Materials
			and methods section in the manuscript.

Nucleic Acid Processing Fields

Name	Туре	Attributes	Definition
template_class	string	required	The class of nucleic acid that was used as primary start-
-	U	1	ing material for the following procedures
template_quality	string	required, nul-	Description and results of the quality control performed
comprace_quarrey	Sumg	lable	on the template material
template_amount	number	required, nul-	Amount of template that went into the process
comprace_amoure	number	lable	A mount of template that went into the process
	miltalogy	required, nul-	Unit of template amount
comprace_amounte_d	ind drotogy	lable	
library_generatio	nstmientehod	required	Generic type of library generation
library_generation	-	required, nul-	Description of processes applied to substrate to obtain a
		lable	library that is ready for sequencing
library_generatio	nstkrinte version		When using a library generation protocol from a com-
iibiui y_generatie	item in the second second	lable	mercial provider, provide the protocol version number
pcr_target	array of PCR-	optional	If a PCR step was performed that specifically targets the
per_target		optional	IG/TR loci, the target and primer locations need to be
	Target		
			provided here. This field holds an array of PCRTarget
			objects, so that multiplex PCR setups amplifying mul-
			tiple loci at the same time can be annotated using one
			record per locus. PCR setups not targeting any specific
			locus must not annotate this field but select the appro-
			priate library_generation_method instead.
complete_sequence	sstring	required	To be considered <i>complete</i> , the procedure used for li-
			brary construction MUST generate sequences that 1) in-
			clude the first V gene codon that encodes the mature
			polypeptide chain (i.e. after the leader sequence) and
			2) include the last complete codon of the J gene (i.e. 1
			bp 5' of the J->C splice site) and 3) provide sequence
			information for all positions between 1) and 2). To be
			considered <i>complete & untemplated</i> , the sections of the
			sequences defined in points 1) to 3) of the previous sen-
			tence MUST be untemplated, i.e. MUST NOT over-
			lap with the primers used in library preparation. <i>mixed</i>
			should only be used if the procedure used for library con-
			struction will likely produce multiple categories of se-
			quences in the given experiment. It SHOULD NOT be
			used as a replacement of a NULL value.
physical_linkage	string	required	In case an experimental setup is used that physically
piny sical_linkaye	sumg	requireu	links nucleic acids derived from distinct <i>Rearrange</i> -
			<i>ments</i> before library preparation, this field describes the
			mode of that linkage. All <i>hetero</i> _* terms indicate that
			in case of paired-read sequencing, the two reads should
			be expected to map to distinct IG/TR loci. *_ <i>head-head</i>
			refers to techniques that link the 5' ends of transcripts
			in a single-cell context. *_ <i>tail-head</i> refers to techniques
			that link the 3' end of one transcript to the 5' end of an-
			other one in a single-cell context. This term does not
			provide any information whether a continuous reading-
			frame between the two is generated. *_ <i>prelinked</i> refers
			to constructs in which the linkage was already present
			on the DNA level (e.g. scFv).

PCR Target Locus Fields

Download as TSV

Name	Туре	Attributes	S	Definition
pcr_target_locus	string	required,	nul-	Designation of the target locus. Note that this field uses a
		lable		controlled vocubulary that is meant to provide a generic
				classification of the locus, not necessarily the correct
				designation according to a specific nomenclature.
forward_pcr_prime	rsttiangget_loca	t ieq uired,	nul-	Position of the most distal nucleotide templated by the
		lable		forward primer or primer mix
reverse_pcr_prime	rsttiangget_loca	t ieq uired,	nul-	Position of the most proximal nucleotide templated by
		lable		the reverse primer or primer mix

Raw Sequence Data Fields

Download as TSV

Sequencing Run Fields

Download as TSV

Name	Туре	Attributes	Definition
sequencing_run_id	l string	required, nul-	ID of sequencing run assigned by the sequencing facility
		lable	
total_reads_passi	n <u>int</u> gerfilter	required, nul-	Number of usable reads for analysis
		lable	
sequencing_platfo	rntring	required, nul-	Designation of sequencing instrument used
		lable	
sequencing_facili	t s tring	required, nul-	Name and address of sequencing facility
		lable	
sequencing_run_da	tsetring	required, nul-	Date of sequencing run
		lable	
sequencing_kit	string	required, nul-	Name, manufacturer, order and lot numbers of sequenc-
		lable	ing kit
sequencing_files	Sequencing-	optional	Set of sequencing files produced by the sequencing run
	Data		

Data Processing Fields

Name Type	Attributes	Definition
data_processing_idstring	optional, iden- tifier, nullable	Identifier for the data processing object.
primary_annotationboolean	optional, iden- tifier	If true, indicates this is the primary or default data pro- cessing for the repertoire and its rearrangements. If false, indicates this is a secondary or additional data pro- cessing.
software_versions string	required, nul- lable	Version number and / or date, include company pipelines
paired_reads_assem ktlin g	required, nul- lable	How paired end reads were assembled into a single re- ceptor sequence
quality_thresholdsstring	required, nul- lable	How sequences were removed from (4) based on base quality scores
primer_match_cutofsfising	required, nul- lable	How primers were identified in the sequences, were they removed/masked/etc?
collapsing_method string	required, nul- lable	The method used for combining multiple sequences from (4) into a single sequence in (5)
data_processing_prstimgols	required, nul- lable	General description of how QC is performed
data_processing_fidmersy of string	optional, nul- lable	Array of file names for data produced by this data processing.
germline_database string	required, nul- lable	Source of germline V(D)J genes with version number or date accessed.
germline_set_ref string	optional, nul- lable	Unique identifier of the germline set and version, in stan- dardized form (Repo:Label:Version)
analysis_provenancstring	optional, nul- lable	Identifier for machine-readable PROV model of analysis provenance

Rearrangement Schema

A Rearrangement is a sequence which describes a rearranged adaptive immune receptor chain (e.g., antibody heavy chain or TCR beta chain) along with a host of annotations. These annotations are defined by the AIRR Rearrangement schema and comprises eight categories.

Cate-	Description
gory	
Input	The input sequence to the V(D)J assignment process.
Identi-	Primary and foreign key identifiers for linking AIRR data across files and databases.
fiers	
Primary	The primary outputs of the V(D)J assignment process, which includes the gene locus, V, D, J, and C
Annota-	gene calls, various flags, $V(D)J$ junction sequence, copy number (duplicate_count), and the number
tions	of reads contributing to a consensus input sequence (consensus_count).
Align-	Detailed alignment annotations including the input and germline sequences used in the alignment; score,
ment	identity, statistical support (E-value, likelihood, etc); and the alignment itself through CIGAR strings
Annota-	for each aligned gene.
tions	
Align-	The start/end positions for genes in both the input and germline sequences.
ment	
Posi-	
tions	
Region	Sequence annotations for the framework regions (FWRs) and complementarity-determining regions
Se-	(CDRs).
quence	
Region	Positional annotations for the framework regions (FWRs) and complementarity-determining regions
Posi-	(CDRs).
tions	
Junction	Lengths for junction sub-regions associated with aspects of the V(D)J recombination process.
Lengths	

File Format Specification

Data for Rearrangement or Alignment objects are stored as rows in a *tab-delimited* file and should be compatible with any TSV reader.

Encoding

- The file should be encoded as ASCII or UTF-8.
- Everything is case-sensitive.

Dialect

- The record separator is a newline n and the field separator is a tab t.
- Fields or data should not be quoted.
- A header line with the AIRR-specified column names is always required.
- Values must not contain tab or newline characters.
- Values should avoid @, #, and quote (" or ') characters, as the result may be implementation dependent.
- Nested delimiters are not supported by the schema explicitly and should be avoided. However, if multiple values must be reported in a single column for an application specific reason, then the use of a comma as the delimiter is recommended.

File names

AIRR formatted TSV files should end with .tsv.

File Structure

The data file has two sections in this order:

- 1. Header. A single line with column names.
- 2. Data values. One record per line.

A comment section preceding the header (e.g., # or @ blocks) is not part of the specification, but such a section is reserved for potential inclusion in a future release. As such, a comment section should not be included in the file as it *may* be incompatible with a future specification.

Header

A single line containing the column names and specifying the field order. Any field that corresponds to one of the defined fields should use the specified field name.

Required columns

Some of the fields are defined as required and therefore must always be present in the header. Note, however, that all columns allow for null values. Therefore, required columns exist to define a core set of fields that are always present in the table structure, but do not mandate that a value be reported.

Custom columns

There are no restrictions on inclusion of additional custom columns in the Rearrangements file, provided such columns do not use the same name as an existing required or optional field. It is recommended that custom fields follow the same naming scheme as existing fields. Meaning, **snake_case** with narrowing scope when read from left to right. For example, **sequence_id** is the "*identifier* of the *query sequence*".

Consider submitting a pull request for a field name reservation to the airr-standards repository if the field may be broadly useful.

Ordering

There are no requirements that fields or records be sorted or ordered in any specific way. However, the field ordering provided by the schema is a recommended default, with top-to-bottom equating to left-to-right.

Data Values

The possible data types are string, boolean, number (floating point), integer, and null (empty string).

Boolean values

Boolean values must be encoded as T for true and F for false.

Null values

All fields may contain null values. This includes columns that are described as required. A null value should be encoded as an empty string.

Coordinate numbering

All alignment sequence coordinates use the same scheme as IMGT and INSDC (DDBJ, ENA, GenBank), with the exception that partial coordinate information should not be used in favor of simply assigning the start/end of the alignment. Meaning, coordinates should be provided as 1-based values with closed intervals, without the use of > or < annotations that denoted a partial region.

CIGAR specification

Alignments details are specified using the CIGAR format as defined in the SAM specifications, with some vocabulary restrictions on the use of clipping, skipping, and padding operators.

The CIGAR string defines the reference sequence as the germline sequence of the given gene or region; e.g., for v_cigar the reference is the V gene germline sequence. The query sequence is what was input into the alignment tool, which must correspond to what is contained in the sequence field of the Rearrangement data. For the majority of use cases, this will necessarily exclude alignment spacers from the CIGAR string, such as IMGT numbering gaps. However, any gaps appearing in the query sequence should be accounted for in the CIGAR string so that the alignment between the query and reference is correctly represented.

The valid operator sets and definitions are as follows:

Operator	Description
=	An identical non-gap character.
Х	A differing non-gap character.
М	A positional match in the alignment. This can be either an identical (=) or differing (x)
	non-gap character.
D	Deletion in the query (gap in the query).
Ι	Insertion in the query (gap in the reference).
S	Positions that appear in the query, but not the reference. Used exclusively to denote the start
	position of the alignment in the query. Should precede any N operators.
N	A space in the alignment. Used exclusively to denote the start position of the alignment in
	the reference. Should follow any S operators.

Note, the use of either the =/X or M syntax is valid, but should be used consistently. While leading S and N operators are required, tailing S and N operators are optional.

For example, an D gene alignment that starts at position 419 in the query sequence (leading 418S), that is 16 nucleotides long with no indels (middle 16M), has an 10 nucleotide 5' deletion (leading 10N), a 5 nucleotide 3' deletion

(trailing 5N), and ends 72 nucleotides from the end of the query sequence (trailing 71S) would have the following D gene CIGAR string (d_cigar) and positional information:

Field	Value
d_cigar	418S10N16M71S5N
d_sequence_start	419
d_sequence_end	434
d_germline_start	11
d_germline_end	26

Definition Clarifications

Junction versus CDR3

We work with the IMGT definitions of the junction and CDR3 regions. Specifically, the IMGT JUNCTION includes the conserved cysteine and tryptophan/phenylalanine residues, while CDR3 excludes those two residues. Therefore, our junction and junction_aa fields which represent the extracted sequence include the two conserved residues, while the coordinate fields (cdr3_start and cdr3_end) exclude them.

Productive

The schema does not define a strict definition of a productive rearrangement. However, the IMGT definition is recommended:

- 1. Coding region has an open reading frame
- 2. No defect in the start codon, splicing sites or regulatory elements.
- 3. No internal stop codons.
- 4. An in-frame junction region.

Locus names

A naming convention for locus names is not strictly enforced, but the IMGT locus names are recommended. For example, in the case of human data, this would be the set: IGH, IGK, IGL, TRA, TRB, TRD, or TRG.

Gene and allele names

Gene call examples use the IMGT nomenclature, but no specific gene or allele nomenclature is strictly mandated. Species denotations may or may not be included in the gene name, as appropriate. For example, "Homo sapiens IGHV4-59*01", "IGHV4-59*01" and "AB019438" are all valid entries for the same allele.

However, when using an established reference database to assign gene calls adherence to the exact nomenclature used by the reference database is strongly recommended, as this will facilitate mapping to the database entries, cross-study comparison, and upload to public repositories.

Alignments

There is no required alignment scheme for the nucleotide and amino acid alignment fields. These fields may, or may not, include numbering spacers (e.g., IMGT-numbering gaps), variations in case to denote mismatches, deletions, or other features appropriate to the tool that performed the alignment. The only strict requirement is that the query (sequence) and reference (germline) **must** be properly aligned.

Frameshifts

For purposes of annotating alignments, a frameshift is defined as a frameshift that is maintained until the end of the aligned gene, where frames are designated numerically as 1 (in-frame), 2, or 3. For example, an V gene alignment that starts in frame 1 and ends in frame 2, disrupting the conserved cystine, would be defined as a frameshift. Whereas, a V gene alignment with an internal frameshift that corrects with a second frameshift, back to the original frame 1 prior to the conserved cystine, would not need to be annotated as a frameshift.

Fields

The specification includes two classes of fields. Those that are required and those that are optional. Required is defined as a column that must be present in the header of the TSV. Optional is defined as column that may, or may not, appear in the TSV. All fields, including required fields, are nullable by assigning an empty string as the value. There are no requirements for column ordering in the schema, although the Python and R reference APIs enforce ordering for the sake of generating predictable output. The set of optional fields that provide alignment and region coordinates ("_start" and "_end" fields) are defined as 1- based closed intervals, similar to the SAM, VCF, GFF, IMGT, and INDSC formats (GenBank, ENA, and DDJB; http://www.insdc.org).

Most fields have strict definitions for the values that they contain. However, some commonly provided information cannot be standardized across diverse toolchains, so a small selection of fields have context-dependent definitions. In particular, these context-dependent fields include the optional "_score," "_identity," and "_support" fields used for assessing the quality of alignments which vary considerably in definition based on the methodology used. Similarly, the "_alignment" fields require strict alignment between the corresponding observed and germline sequences, but the manner in which that alignment is conveyed is somewhat flexible in that it allows for any numbering scheme (e.g., IMGT or KABAT) or lack thereof.

By default, data elements representing sequences in the schema contain nucleotide sequences except for data elements ending in "_aa," which are amino acid translations of the associated nucleotide sequence.

While the format contains an extensive list of reserved field names, there are no restrictions on inclusion of custom fields in the TSV file, provided such custom fields have a unique name. Furthermore, suggestions for extending the format with additional reserved names are welcomed through the issue tracker on the GitHub repository (https://github. com/airr-community/airr-standards).

Name	Туре	Attributes	Definition
sequence_id	string	required, identifier, nullable	Unique query sequence identifier for the Rearrangement. Most often this will be the input sequence header or a substring thereof, but may also be a custom identi- fier defined by the tool in cases where query sequences have been combined in some fashion prior to alignment. When downloaded from an AIRR Data Commons repos- itory, this will usually be a universally unique record lo- cator for linking with other objects in the AIRR Data Model.
sequence	string	required, nul- lable	The query nucleotide sequence. Usually, this is the un- modified input sequence, which may be reverse comple- mented if necessary. In some cases, this field may con- tain consensus sequences or other types of collapsed in- put sequences if these steps are performed prior to align- ment.
quality	string	optional, nul- lable	The Sanger/Phred quality scores for assessment of se- quence quality. Phred quality scores from 0 to 93 are encoded using ASCII 33 to 126 (Used by Illumina from v1.8.)
sequence_aa	string	optional, nul- lable	Amino acid translation of the query nucleotide se- quence.
rev_comp	boolean	required, nul- lable	True if the alignment is on the opposite strand (reverse complemented) with respect to the query sequence. If True then all output data, such as alignment coordinates and sequences, are based on the reverse complement of 'sequence'.
productive	boolean	required, nul- lable	True if the V(D)J sequence is predicted to be productive.
vj_in_frame	boolean	optional, nul- lable	True if the V and J gene alignments are in-frame.
stop_codon	boolean	optional, nul- lable	True if the aligned sequence contains a stop codon.
complete_vdj	boolean	optional, nul- lable	True if the sequence alignment spans the entire $V(D)J$ region. Meaning, sequence_alignment includes both the first V gene codon that encodes the mature polypeptide chain (i.e., after the leader sequence) and the last complete codon of the J gene (i.e., before the J-C splice site). This does not require an absence of deletions within the internal FWR and CDR regions of the alignment.
locus	string	optional, nul- lable	Gene locus (chain type). Note that this field uses a con- trolled vocabulary that is meant to provide a generic clas- sification of the locus, not necessarily the correct desig- nation according to a specific nomenclature.
v_call	string	required, nul- lable	V gene with allele. If referring to a known reference sequence in a database the relevant gene/allele nomen- clature should be followed (e.g., IGHV4-59*01 if using IMGT/GENE-DB).
d_call	string	required, nul- lable	First or only D gene with allele. If referring to a known reference sequence in a database the relevant gene/allele nomenclature should be followed (e.g., IGHD3-10*01 if using IMGT/GENE-DB).

	Type string	Attributes optional, nul- lable	Definition Second D gene with allele. If referring to a known ref-
	Sumg	-	
j_call			erence sequence in a database the relevant gene/allele
j_call		14010	nomenclature should be followed (e.g., IGHD3-10*01
j_call			if using IMGT/GENE-DB).
	ataina		
	string	required, nul-	J gene with allele. If referring to a known reference
		lable	sequence in a database the relevant gene/allele nomen-
			clature should be followed (e.g., IGHJ4*02 if using
			IMGT/GENE-DB).
c_call	string	optional, nul-	Constant region gene with allele. If referring to a known
		lable	reference sequence in a database the relevant gene/allele
			nomenclature should be followed (e.g., IGHG1*01 if us-
			ing IMGT/GENE-DB).
sequence_alignment	string	required, nul-	Aligned portion of query sequence, including any indel
		lable	corrections or numbering spacers, such as IMGT-gaps.
			Typically, this will include only the V(D)J region, but
			that is not a requirement.
quality_alignment	string	optional, nul-	Sanger/Phred quality scores for assessment of se-
. , , , , , , , , , , , , , , , , , , ,	6	lable	quence_alignment quality. Phred quality scores from 0
			to 93 are encoded using ASCII 33 to 126 (Used by Illu-
			mina from v1.8.)
sequence_alignment	staniano	optional, nul-	Amino acid translation of the aligned query sequence.

psuz_rengen	Integer	lable	-
n E i lanath			gene alignment.
p5j_length	integer	optional, nul-	Number of palindromic nucleotides 5' of the J gene
	1 1	lable	alignment.
v_frameshift	boolean	optional, nul-	True if the V gene in the query nucleotide sequence con-
		lable	tains a translational frameshift relative to the frame of
	1 1		the V gene reference sequence.
j_frameshift	boolean	optional, nul-	True if the J gene in the query nucleotide sequence con-
		lable	tains a translational frameshift relative to the frame of
			the J gene reference sequence.
d_frame	integer	optional, nul-	Numerical reading frame (1, 2, 3) of the first or only D
		lable	gene in the query nucleotide sequence, where frame 1 is
			relative to the first codon of D gene reference sequence.
d2_frame	integer	optional, nul-	Numerical reading frame (1, 2, 3) of the second D gene
		lable	in the query nucleotide sequence, where frame 1 is rela-
			tive to the first codon of D gene reference sequence.
consensus_count	integer	optional, nul-	Number of reads contributing to the UMI consensus or
		lable	contig assembly for this sequence. For example, the sum
			of the number of reads for all UMIs that contribute to the
			query sequence.
duplicate_count	integer	optional, nul-	Copy number or number of duplicate observations for
		lable	the query sequence. For example, the number of identi-
			cal reads observed for this sequence.
umi_count	integer	optional, nul-	Number of distinct UMIs represented by this sequence.
		lable	For example, the total number of UMIs that contribute
			to the contig assembly for the query sequence.
cell_id	string	optional, iden-	Identifier defining the cell of origin for the query se-
		tifier, nullable	quence.
clone_id	string	optional, iden-	Clonal cluster assignment for the query sequence.
		tifier, nullable	
repertoire_id	string	optional, iden-	Identifier to the associated repertoire in study metadata.
-		tifier, nullable	
sample_processing		optional, iden-	Identifier to the sample processing object in the reper-
		tifier, nullable	toire metadata for this rearrangement. If the repertoire
		, í	has a single sample then this field may be empty or miss-
			ing. If the repertoire has multiple samples then this field
			may be empty or missing if the sample cannot be differ-
			entiated or the relationship is not maintained by the data
			processing.
data_processing_:	idstring	optional, iden-	Identifier to the data processing object in the repertoire
	6	tifier, nullable	metadata for this rearrangement. If this field is empty
			than the primary data processing object is assumed.
rearrangement_id	string	DEPRE-	Identifier for the Rearrangement object. May be iden-
_ carrangement_ru		CATED	tical to sequence_id, but will usually be a universally
			unique record locator for database applications.
rearrangement_set	t siteling	DEPRE-	Identifier for grouping Rearrangement objects.
rearrangement_3e		CATED	Remainer for grouping Rearrangement objects.

Name	Туре	Attributes	Definition
germline_database	string	DEPRE-	Source of germline V(D)J genes with version number or
		CATED	date accessed.

Alignment Schema (Experimental)

An Alignment is the output from a V(D)J assignment process for a single V, D, J, or C gene for a sequence. It is not necessary that the V(D)J assignment process performs a sequence alignment algorithm, as the schema can support any algorithmic process. Multiple Alignment records are supported and expected for a single sequence with context-dependent fields (score, identity, support, rank) for assessing the quality of assignments that can vary considerably in definition based on the methodology used.

Note, this schema definition is still experimental and should not be considered final.

File Format Specification

The *format specification* describes the file format and details on how to structure this data.

Fields

Name	Туре	Attributes	Definition
sequence_id	string	required, nul- lable	Unique query sequence identifier within the file. Most often this will be the input sequence header or a sub- string thereof, but may also be a custom identifier de- fined by the tool in cases where query sequences have been combined in some fashion prior to alignment.
segment	string	required, nul- lable	The segment for this alignment. One of V, D, J or C.
rev_comp	boolean	optional, nul- lable	Alignment result is from the reverse complement of the query sequence.
call	string	required, nul- lable	Gene assignment with allele.
score	number	required, nul- lable	Alignment score.
identity	number	optional, nul- lable	Alignment fractional identity.
support	number	optional, nul- lable	Alignment E-value, p-value, likelihood, probability or other similar measure of support for the gene assignment as defined by the alignment tool.
cigar	string	required, nul- lable	Alignment CIGAR string.
sequence_start	integer	optional, nul- lable	Start position of the segment in the query sequence (1-based closed interval).
sequence_end	integer	optional, nul- lable	End position of the segment in the query sequence (1-based closed interval).
germline_start	integer	optional, nul- lable	Alignment start position in the reference sequence (1-based closed interval).
germline_end	integer	optional, nul- lable	Alignment end position in the reference sequence (1-based closed interval).
rank	integer	optional, nul- lable	Alignment rank.
rearrangement_id	string	DEPRE- CATED	Identifier for the Rearrangement object. May be iden- tical to sequence_id, but will usually be a universally unique record locator for database applications.
data_processing_i	dstring	optional, nul- lable	Identifier to the data processing object in the repertoire metadata for this rearrangement. If this field is empty than the primary data processing object is assumed.
germline_database	string	DEPRE- CATED	Source of germline V(D)J genes with version number or date accessed.

Clone and Lineage Tree Schema (Experimental)

A unique inferred clone object that has been constructed within a single data processing for a single repertoire and a subset of its sequences and/or rearrangements.

A clone object may have one or more inferred lineage trees. Each tree is represented by a Newick string for its edges and a dictionary of node objects.

File Format Specification

The file format has not been specified yet.

Clone Fields

Name	Туре	Attributes	Definition
clone_id	string	required, nul-	Identifier for the clone.
repertoire_id	string	lable optional, nul-	Identifier to the associated repertoire in study metadata.
Teper corre_ru	string	lable	identifier to the associated repertone in study incladata.
data_processing_i	dstring	optional, nul-	Identifier of the data processing object in the repertoire
	_	lable	metadata for this clone.
sequences	array of string	optional, nul- lable	List sequence_id strings that act as keys to the Rear- rangement records for members of the clone.
v_call	string	optional, nul- lable	V gene with allele of the inferred ancestral of the clone. For example, IGHV4-59*01.
d_call	string	optional, nul- lable	D gene with allele of the inferred ancestor of the clone. For example, IGHD3-10*01.
j_call	string	optional, nul- lable	J gene with allele of the inferred ancestor of the clone. For example, IGHJ4*02.
junction	string	optional, nul-	Nucleotide sequence for the junction region of the in-
		lable	ferred ancestor of the clone, where the junction is de-
			fined as the CDR3 plus the two flanking conserved codons.
junction_aa	string	optional, nul- lable	Amino acid translation of the junction.
junction_length	integer	optional, nul- lable	Number of nucleotides in the junction.
junction_aa_leng	hinteger	optional, nul- lable	Number of amino acids in junction_aa.
germline_alignmer	tstring	required, nul-	Assembled, aligned, full-length inferred ancestor of
		lable	the clone spanning the same region as the se-
			quence_alignment field of nodes (typically the V(D)J re-
			gion) and including the same set of corrections and spacers (if any).
germline_alignmer	itstaiang	optional, nul- lable	Amino acid translation of germline_alignment.
v_alignment_start	integer	optional, nul-	Start position in the V gene alignment in both the se-
-		lable	quence_alignment and germline_alignment fields (1-based closed interval).
v_alignment_end	integer	optional, nul-	End position in the V gene alignment in both the se-
		lable	quence_alignment and germline_alignment fields (1-
<u> </u>			based closed interval).
d_alignment_start	integer	optional, nul-	Start position of the D gene alignment in both the se-
		lable	quence_alignment and germline_alignment fields (1-based closed interval).
d_alignment_end	integer	optional, nul-	End position of the D gene alignment in both the se-
<u>~_</u> ~	lineger	lable	quence_alignment and germline_alignment fields (1-
			based closed interval).
j_alignment_start	integer	optional, nul-	Start position of the J gene alignment in both the se-
		lable	quence_alignment and germline_alignment fields (1-
1			based closed interval).
j_alignment_end	integer	optional, nul-	End position of the J gene alignment in both the se-
		lable	quence_alignment and germline_alignment fields (1-based closed interval).
junction_start	integer	optional, nul-	Junction region start position in the alignment (1-based
5 <u>-</u> car c		lable	closed interval).
junction_end	integer	optional, nul- lable	Junction region end position in the alignment (1-based closed interval).
2.3. AIRR Standard	s ^{integer}	optional, nul-	Number of distinct UMIs observed across all sequence 33
		lable	(Rearrangement records) in this clone.
clone_count	integer	optional, nul- lable	Absolute count of the size (number of members) of this clone in the repertoire. This could simply be the num-
			ber of sequences (Rearrangement records) observed in

Tree Fields

Download as TSV

Name	Туре	Attributes	Definition
tree_id	string	required, nul-	Identifier for the tree.
		lable	
clone_id	string	required, nul-	Identifier for the clone.
		lable	
newick	string	required, nul-	Newick string of the tree edges.
		lable	
nodes	object	optional, nul-	Dictionary of nodes in the tree, keyed by sequence_id
		lable	string

Node Fields

Download as TSV

Name	Туре	Attributes	Definition	
sequence_id	string	required, nul-	Identifier for this node that matches the identifier in the	
		lable	newick string and, where possible, the sequence_id in	
			the source repertoire.	
sequence_alignmer	tstring	optional, nul-	Nucleotide sequence of the node, aligned to the	
		lable	germline_alignment for this clone, including including	
			any indel corrections or spacers.	
junction	string	optional, nul-	Junction region nucleotide sequence for the node, where	
		lable	the junction is defined as the CDR3 plus the two flanking	
			conserved codons.	
junction_aa	string	optional, nul-	Amino acid translation of the junction.	
		lable		

Cell Schema (Experimental)

The cell object acts as point of reference for all data that can be related to an individual cell, either by direct observation or inference.

File Format Specification

The file format has not been specified yet.

Cell Fields

Download as TSV

Name	Туре	Attributes	Definition
cell_id	string	required	Identifier defining the cell of origin for the query se-
			quence.
rearrangements	array of string	required, nul-	Array of sequence identifiers defined for the Rearrange-
		lable	ment object
receptors	array of string	optional, nul-	Array of receptor identifiers defined for the Receptor ob-
		lable	ject
repertoire_id	string	required, nul-	Identifier to the associated repertoire in study metadata.
		lable	
data_processing_i	dstring	optional, nul-	Identifier of the data processing object in the repertoire
		lable	metadata for this clone.
expression_study_m sting d		optional, nul-	keyword describing the methodology used to assess ex-
		lable	pression. This values for this field MUST come from a
			controlled vocabulary
expression_raw_do	istring	optional, nul-	DOI of raw data set containing the current event
		lable	
expression_index	string	optional, nul-	Index addressing the current event within the raw data
		lable	set.
virtual_pairing	boolean	required, nul-	boolean to indicate if pairing was inferred.
		lable	

Cell Expression Schema (Experimental)

File Format Specification

The file format has not been specified yet.

Cell Expression Fields

Name	Туре	Attributes	Definition
expression_id	string	required Identifier of this expression property measurement.	
cell_id	string	required	Identifier of the cell to which this expression data is re-
			lated.
repertoire_id	string	optional, nul-	Identifier for the associated repertoire in study metadata.
		lable	
data_processing_i	dstring	required, nul-	Identifier of the data processing object in the repertoire
		lable	metadata for this clone.
property	Ontology	required, nul-	Name of the property observed, typically a gene or anti-
		lable	body idenifier (and its label) from a canonical resource
			such as Ensembl (e.g. ENSG00000275747, IGHV3-79)
			or Antibody Registry (ABREG:1236456, Purified anti-
			mouse/rat/human CD27 antibody).
value	number	required, nul-	Level at which the property was observed in the experi-
		lable	ment (non-normalized).

Germline Schema (Experimental)

Motivation

Understanding and cataloguing receptor germline genes and allele sequences is critical to the analysis of AIRR data. While the human set is relatively well understood in outline, although probably still far from complete, those of other species, even those that are relatively closely studied, is at a much earlier stage. There is an urgent need to define a standardised format for listing such genes, so that they can be shared between researchers and easily consumed by software tools.

Receptor Germline Schema

The receptor germline schema defines the data elements necessary to describe one or more receptor germline genes, together with supporting evidence. The fundamental object is the AlleleDescription, which describes a single gene or allele, containing the necessary details for the annotation of a rearranged sequence such as the location of CDRs (in the case of a V-gene) and framing information (in the case of a J-gene). AlleleDescription also contains fields to delineate RSS, and the leader regions of V-genes, should those be covered by the sequence provided.

Evidence supporting the gene or allele can be provided in linked UnrearrangedSequence and RearrangedSequence objects. Information represented in these objects will typically be stored in a repository: either an INSDC repository such as Genbank or SRA, or a lower-tier repository such as OGRDB. Please note that the key distinction between these object types is whether the V(D)J genes have rearranged, rather than the origin of the material, as mature B and T cells carry rearranged sequences in chromosomal DNA. It is most likely that supporting sequences will be UnrearrangedSequences, i.e. prior to rearrangement. In the case of a germline inference from a repertoire, the inferred germline sequence should be provided as a RearrangedSequence, if the evidence has been deposited in a repository.

For V-genes, an IMGT-gapped sequence (i.e.,. a sequence delineated in accordance with the IMGT numbering scheme) is provided in AlleleDescription. Other delineations, such as Chothia and Kabat, can be provided via linked SequenceDelineationV objects. A GermlineSet brings together multiple AlleleDescriptions from the same locus to form a curated set. The schema assumes that germline sets will be published by multiple repositories. A germline set may be uniquely referenced by means of the germline_set_ref, which is a composite field containing the repository id, germline set label, and version.

Gene and Allele Naming

AlleleDescription contains a label field, which should contain the accepted name for the field, as determined by the authors/curators of the record. The Nomenclature Committee of the International Union of Immunological Societies (IUIS) allocates gene symbols for receptor genes, and, if a gene symbol has been allocated, this should be used as the label. Where a gene symbol has not been allocated (for example, because the gene or allele has only recently been discovered, or because the available evidence does not meet IUIS standards, a 'temporary label' should be used. It is anticipated that publishers of gene sets will provide mechanisms to issue these temporary labels, and to allow researchers to review change history of AlleleDescriptions and GermlineSets. To provide consistency across research groups, the Germline Database Working Group of the AIRR Community is developing a community-wide approach to the allocation of temporary labels.

Genotypes

A GenotypeSet describes the specific receptor alleles found in a subject, and also identifies genes that are not found (this could be either because they are not present in the chromosomal locus, or because they are not expressed or expressed only at low levels). Depending on the data available and the inference method used, genotypes may contain haplotyping information, which may be full, or partial. As an example of partial haplotyping, the genotype may have been determined from genomic sequencing in which the sequence of the locus was assembled into contigs, but could not be fully assembled. In this case the co-location of alleles in each contig has been established, but the co-location across the entire locus can not be. Co-location is therefore indicated by means of the phasing parameter, which in this case would be assigned a different value for alleles on each contig.

MHC Genotypes

Similary to the IG/TR genotypes, the MHCGenotype amd MHCGenotypeSet objects describe the MHC alleles found in a subject. MHCGenotype objects assemble alleles from one class: MHC-I, MHC-II or MHC-nonclassical. The method used to determine the genotype can be provided in the mhc_genotyping_method field. As different methods might be use for the various classes, this field is located in the *MHCGenotype* object, not the MHCGenotypeSet.

The mhc_genotyping_method allows free-text descriptions, however data curators are asked to keep close to the following terms if applicable:

- PCR-based typing: Methods whose read-out is the amplification of specific sequences, but which do not provide sequence data by themselves. This includes SSP and SSOP.
- Sequencing-based typing: Clinical-grade NGS-based assays, providing high quality and resolution.
- Inference-based typing: Allele inferrence based on genome-wide DNA or RNA sequencing.

File Format Specification

Files are YAML/JSON with a structure defined below. Files should be encoded as UTF-8. Identifiers are case-sensitive. Files should have the extension .yaml, .yml, or .json.

Germline Set File Structure

The Germline Set file has a standardised structure that is utilized by all top-level AIRR Schema Objects and defined by the DataFile schema. It is intended to contan all information necessary to annotate receptor sequences derived from a single germline locus, and to be directly usable by annotation tools and other processing software.

The file must contain YAML or JSON representation of one or more GermlineSet objects, including the associated AlleleDescription objects. It may optionally include other associated objects: SequenceDelineationV, RearrangedSequence, UnrearrangedSequence, Acknowledgement. These should all be embedded into the overall GermlineSet as specified in the schema.

- The file as a whole is considered a dictionary (key/value pair) structure with the keys Info, GermlineSet, and AlleleDescription.
- The GermlineSet contains fields release_version, release_description and release_date, which are intended to be used for version identification, under the control of the authors of the GermlineSet as identified by the fields author, lab_name and lab_address. If the set is modified by a party other than these authors, that these 6 fields should be modified to reflect the authors of the modification, and their own version identication. These modifications MUST be made if the GermlineSet is, or is likely to become, public, in order to avoid confusion with the original set prior to modification. Repositories are encouraged to manage version fields automatically.

- The file can (optionally) contain an Info object, at the beginning of the file, based upon the Info schema in the OpenAPI specification. If provided, version in Info should reference the version of the AIRR schema for the file.
- The file should correspond to a list of GermlineSet objects, using GermlineSet as the key to the list.
- The file should correspond to a list of AlleleDescription objects, using AlleleDescription as the key to the list.
- There should be only one AlleleDescription for each allele in the list.
- Each AlleleDescription object should contain a top-level key/value pair for allele_description_id that uniquely identifies the allele description object in the file.
- Each GermlineSet object should contain a top-level key/value pair for germline_set_id that uniquely identifies the germline set object in the file.
- Some fields require the use of a particular ontology or controlled vocabulary.
- GermlineSet and AlleleDescription contain reference fields germline_set_ref and allele_description_ref. These are intended to be globally unique references (containing identifiers of the repository, object and version) that can be used in a query API.
- The structure is the same regardless of whether the data is stored in a file or retrieved from a data repository. For example, The *ADC API* will return a properly structured JSON object that can be saved to a file and used directly without modification.

GermlineSet Fields

Name	Туре	Attributes	Definition
germline_set_id	string	required	Unique identifier of the GermlineSet within this file, typ-
			ically generated by the repository hosting the schema, for
			example from the underlying ID of the database record
author	string	required	Corresponding author
lab_name	string	required	Department of corresponding author
lab_address	string	required	Institutional address of corresponding author
acknowledgements	array of	optional, nul-	List of individuals whose contribution to the germline
	Acknowledge-	lable	set should be acknowledged
	ment		
release_version	number	required	Version number of this record, allocated automatically
release_descripti	.ostring	required	Brief descriptive notes of the reason for this release and
			the changes embodied
release_date	ate string required		Date of this release
germline_set_name	string	required	descriptive name of this germline set
<pre>germline_set_ref</pre>	string	required	Unique identifier of the germline set and version, in stan-
			dardized form (Repo:Label:Version)
pub_ids	string	optional, nul-	Publications describing the germline set
		lable	
species	Ontology	required	Binomial designation of subject's species
<pre>species_subgroup</pre>	string	optional, nul-	Race, strain or other species subgroup to which this sub-
		lable	ject belongs
<pre>species_subgroup_</pre>	tsytpieng	optional, nul-	
		lable	
locus	string	required	Gene locus
allele_descriptio	•	required	list of allele_descriptions in the germline set
	leleDescrip-		
	tion		
curation	string	optional, nul-	Curational notes on the GermlineSet. This can be used
		lable	to give more extensive notes on the decisions taken than
			are provided in the release_description.

AlleleDescription Fields

Download as TSV

Name	Туре	Attributes	Definition	
allele_descriptio	allele_descriptionstindg		Unique identifier of this AlleleDescription within the	
			file, typically generated by the repository hosting the	
			schema, for example from the underlying ID of the	
			database record	
allele_descriptio	nstrieng	optional	Unique reference to the allele description, in standard-	
			ized form (Repo:Label:Version)	
maintainer	string	required	Maintainer of this sequence record	
acknowledgements	array of	optional, nul-	List of individuals whose contribution to the gene de-	
	Acknowledge-	lable	scription should be acknowledged	
	ment			
lab_address	string	required	Institution and full address of corresponding author	
release_version	integer	required	Version number of this record, updated whenever a re-	
			vised version is published or released	

Name Type Attributes Definition			
release_date	string	required	Date of this release
release_descripti		required	Brief descriptive notes of the reason for this release and
rerease_ueseripti	Juli 1115	required	the changes embodied
label	string	optional, nul-	The accepted name for this gene or allele
Iubei	string	lable	The decepted nume for this gene of there
sequence	string	required	nt sequence of the gene. This should cover the full length
1	8	. 1	that is available, including where possible RSS, and 5'
			UTR and lead-in for V-gene sequences
coding_sequence	string	required	nucleotide sequence of the core region of the gene (V-
0 1	e	1	, D-, J- or C-REGION), aligned, in the case of the V-
			REGION, with the IMGT numbering scheme
aliases	array of string	optional, nul-	Alternative names for this sequence
		lable	1
locus	string	required	Gene locus
chromosome	integer	optional, nul-	chromosome on which the gene is located
	-	lable	
sequence_type	string	required	Sequence type (V, D, J, C)
functional	boolean	required	True if the gene is functional, false if it is a pseudogene
inference_type	string	required	Type of inference(s) from which this gene sequence was
			inferred
species	Ontology	required	Binomial designation of subject's species
<pre>species_subgroup</pre>	string	optional, nul-	Race, strain or other species subgroup to which this sub-
		lable	ject belongs
<pre>species_subgroup_</pre>	tsyppieng	optional, nul-	
		lable	
status	string	optional, nul-	Status of record, assumed active if the field is not present
	-	lable	
subgroup_designat	istning	optional, nul-	Identifier of the gene subgroup or clade, as (and if) de-
<u> </u>		lable	fined
gene_designation	string	optional, nul-	Gene number or other identifier, as (and if) defined
11 1 1		lable	
allele_designatio	nstring	optional, nul-	Allele number or other identifier, as (and if) defined
i andan Guama		lable	Coden norition of the first mulestide in the first
j_codon_frame	integer	optional, nul-	Codon position of the first nucleotide in the 'cod-
		lable	ing_sequence' field. Mandatory for J genes. Not used
			for V or D genes. ('1' means the sequence is in-frame,
			'2' means that the first bp is missing from the first codon,'3' means that the first 2 bp are missing)
aono stant	integer	optional, nul-	Co-ordinate (in the sequence field) of the first nucleotide
gene_start	integer	lable	in the coding_sequence field
gene_end	integer	optional, nul-	Co-ordinate (in the sequence field) of the last gene-
gene_enu	mugu	lable	coding nucleotide in the coding_sequence field
utr_5_prime_start	integer	optional, nul-	Start co-ordinate (in the sequence field) of 5 prime UTR
prime_otar		lable	(V-genes only)
utr_5_prime_end	integer	optional, nul-	End co-ordinate (in the sequence field) of 5 prime UTR

rearranged_suppor	•	optional, nul-	
	Rearranged-	lable	
	Sequence		
paralogs	array of string	optional, nul-	Gene symbols of any paralogs
		lable	
curation	string	optional, nul-	Curational notes on the AlleleDescription. This can be
		lable	used to give more extensive notes on the decisions taken
			than are provided in the release_description.
curational_tags	array of string	optional, nul-	Controlled-vocabulary tags applied to this description
		lable	

Table	3 - continued	from prev	ious page
-------	---------------	-----------	-----------

RearrangedSequence Fields

Download as TSV

Name	Туре	Attributes	Definition
sequence_id	string	required	Unique identifier of this RearrangedSequence within the
			file, typically generated by the repository hosting the
			schema, for example from the underlying ID of the
			database record
sequence	string	required	nucleotide sequence
derivation	string	required	The class of nucleic acid that was used as primary start-
			ing material
observation_type	string	required	The type of observation from which this sequence was
			drawn, e.g. direct sequencing, inference from repertoire
curation	string	optional, nul-	Curational notes on the sequence
		lable	
repository_name	string	required	Name of the repository in which the sequence has been
			deposited
repository_ref	string	optional	Queryable id or accession number of the sequence pub-
			lished by the repository
deposited_versior	string	required	Version number of the sequence within the repository
sequence_start	integer	optional	Start co-ordinate of the sequence detailed in this record,
			within the sequence deposited
sequence_end	integer	optional	End co-ordinate of the sequence detailed in this record,
			within the sequence deposited

UnrearrangedSequence Fields

Name	Туре	Attributes	Definition
sequence_id	string	required	unique identifier of this UnrearrangedSequence within the file
sequence	string	required	Sequence of interest described in this record (typically this will include gene and promoter region)
curation	string	optional, nul- lable	Curational notes on the sequence
repository_name	string	required	Name of the repository in which the assembly or contig is deposited
repository_ref	string	optional	Queryable id or accession number of the sequence pub- lished by the repository
patch_no	string	optional, nul- lable	Genome assembly patch number in which this gene was determined
gff_seqid	string	required, nul- lable	Sequence (from the assembly) of a window including the gene and preferably also the promoter region
gff_start	integer	required, nul- lable	Genomic co-ordinates of the start of the sequence of in- terest described in this record, in Ensemble GFF version 3
gff_end	integer	required, nul- lable	Genomic co-ordinates of the end of the sequence of in- terest described in this record, in Ensemble GFF version 3
strand	string	required, nul- lable	sense (+ or -)

SequenceDelineationV Fields

Name	Туре	Attributes	Definition
sequence_delineatistningd required		required	Unique identifier of this SequenceDelineationV within
			the file, typically generated by the repository hosting
			the schema, for example from the underlying ID of the
			database record
delineation_schem	estring	required	Name of the delineation scheme
fwr1_start	integer	required	FWR1 start co-ordinate in Gene Description 'alignment'
			field
fwr1_end	integer	required	FWR1 end co-ordinate in Gene Description 'alignment'
			field
cdr1_start	integer	required	CDR1 start co-ordinate in Gene Description 'alignment'
			field
cdr1_end	integer	required	CDR1 end co-ordinate in Gene Description 'alignment'
			field
fwr2_start	integer	required	FWR2 start co-ordinate in Gene Description 'alignment'
			field
fwr2_end	integer	required	FWR2 end co-ordinate in Gene Description 'alignment'
			field
cdr2_start	integer	required	CDR2 start co-ordinate in Gene Description 'alignment'
			field
cdr2_end	integer	required	CDR2 end co-ordinate in Gene Description 'alignment'
			field
fwr3_start	integer	required	FWR3 start co-ordinate in Gene Description 'alignment'
			field
fwr3_end	integer	required	FWR3 end co-ordinate in Gene Description 'alignment'
			field
cdr3_start	integer	required	CDR3 start co-ordinate in Gene Description 'alignment'
			field
alignment	array of string	optional, nul-	one string for each codon in the fields v_start to
		lable	cdr3_start indicating the label of that codon according
			to the numbering of the delineation scheme

GenotypeSet Fields

Name	Туре	Attributes	Definition
receptor_genotype	_steingid	required	A unique identifier for this Receptor Genotype Set, typi-
			cally generated by the repository hosting the schema, for example from the underlying ID of the database record
			1
genotype_class_li	sarray of <i>Geno</i> -	optional, nul-	List of Genotypes included in this Receptor Genotype
	type	lable	Set.

Genotype Fields

Download as TSV

Name	Туре	Attributes	Definition
receptor_genotype	_sit d ing	required	A unique identifier within the file for this Receptor
			Genotype, typically generated by the repository hosting
			the schema, for example from the underlying ID of the
			database record
locus	string	required	
documented_allele	sarray of object	optional, nul-	Array of alleles inferred to be present which are docu-
		lable	mented in GermlineSets
undocumented_alle	l æs ay of object	optional, nul-	Array of alleles inferred to be present and not docu-
		lable	mented in an identified GermlineSet
deleted_genes	array of object	optional, nul-	Array of genes identified as being deleted in this geno-
		lable	type
inference_process	string	optional, nul-	Information on how the genotype was acquired. Con-
		lable	trolled vocabulary.

MHCGenotypeSet Fields

Download as TSV

Name	Туре	Attributes	Definition
<pre>mhc_genotype_set_</pre>	i st ring	required	A unique identifier for this MHCGenotypeSet
<pre>mhc_genotype_list</pre>	array of	required	List of MHCGenotypes included in this set
	MHCGeno-		
	type		

MHCGenotype Fields

Download as TSV

Name	Туре	Attributes	Definition
<pre>mhc_genotype_id</pre>	string	required	A unique identifier for this MHCGenotype, assumed to
			be unique in the context of the study
<pre>mhc_class</pre>	string	required	Class of MHC alleles described by the MHCGenotype
mhc_alleles	array of object	required	List of MHC alleles of the indicated mhc_class identified
			in an individual
mhc_genotyping_me	t stoid hg	optional, nul-	Information on how the genotype was determined. The
		lable	content of this field should come from a list of recom-
			mended terms provided in the AIRR Schema documen-
			tation.

Receptor Schema (Experimental)

General

The purpose of the Receptor object is to represent reactivity data of actual *Receptors*, i.e., Ig or TCR, either directly or indirectly. To this end, the Receptor object has two main sections:

- 1. The receptor_* properties: These properties describe the receptor as an abstract and global concept, i.e., the actual Ig/TCR protein complex MAY or MAY NOT have been observed in the current study. However, the Rearrangements encoding the respective chains MUST be present in the studies as well as the information linking them (see below). This allows data curators to provide potential reactivities of a potential receptor by referencing to its entry in an external database (e.g., IEDB).
- 2. The reactivity_measurements array: This structure contains one or more entries, describing reactivities of the receptor that have been observed in the current study.

The Receptor object explicitly requires full sequence information of the two associated variable domains. This is considered to be an acceptable restriction from an AIRR-seq perspective, where sequencing typically precedes or takes place in combination with the determination of receptor reactivity.

Identifiers

The Receptor objects has two properties that serve as identifiers:

- receptor_id is a local identifier and its uniqueness MUST NOT be assumed beyond the scope of the study the receptor was reported in. This property can be used, e.g., to represent designations for Ig/TCR used in a manuscript.
- receptor_hash is the SHA256 hash of the receptors variable domain amino acid sequences, which serves as a **globally unique** identifier that can be independently calculated by repositories without requiring prior communication. It is calculated as follows, where base16 designates the function described in RFC4648 Section 6:

Relations to other AIRR Schema objects

The Receptor object is only directly linked to the Cell object, which then in turn contains the references to the records in the Rearrangements that encode the respective chains of the receptor. Therefore a given rearrangement cannot directly reference to a receptor, which is also not a meaningful thing to do, as the paired chain would be unclear, but is necessary to determine a receptors reactivity.

Annotation guidelines

Reactivity information SHOULD be provided if it was either directly recorded in the current study or is indirectly available in a public database, where it can be linked. If no information about the receptor, besides the translated amino acid sequence of the associated chains is available, the respective object MAY still be created if the curator considers this information to be beneficial, e.g., if there is some evidence (surface expression, reaction to superantigens) that the receptor is functional and present on the surface. In the absence of any such data, Receptor objects SHOULD NOT be created.

Note on cells expressing more than a single receptor

Cells that express more than a single IGH/TRB/TRD or a single IGK/IGL/TRA/TRG chain are regularly observered as allelic exclusion is never complete and its efficiency is rather low for loci like TRA. Such dual-expressing cells can technically be accommodated in the current AIRR Schema as an individual Cell object can link to more than two rearrangemts and to more than a single Receptor. In the case of two potential receptors, both MAY be created as an objects, if the general annotation rules are met (i.e., the direct or indirect presence of reactivity information) for each of them. Note that the annotation of **cell**-based reactivity information is currently not supported for dual-expressing cells, in this case additional information confirming the reactivity of one of the receptors would be required.

Representation of bi-specific antibodies

The goal of the AIRR Standards is primarily to represent naturally occuring receptors. While bi-specific antibodies may arise in dual IGK/IGL expressing B cells their individual reactivity is not measured on a regular basis. Therefore they are currently not supported in the Receptor schema.

Receptor Fields

Download as TSV

Name	Туре	Attributes	Definition
receptor_id	string	required	ID of the current Receptor object, unique within the local
waaantan baab			repository.
receptor_hash	string	required	The SHA256 hash of the receptor amino acid sequence, calculated on the concatenated
			acid sequence, calculated on the concatenated receptor_variable_domain_*_aa sequences
			and represented as base16-encoded string.
receptor_type	string	required	The top-level receptor type, either Immunoglobulin (Ig)
		1	or T Cell Receptor (TCR).
receptor_variable	stomagin_1_aa	required	Complete amino acid sequence of the mature variable
			domain of the Ig heavy, TCR beta or TCR delta chain.
			The mature variable domain is defined as encompassing
			all AA from and including first AA after the the signal
			peptide to and including the last AA that is completely
		-	encoded by the J gene.
receptor_variable_ stoimg in_1_locu s equired		u s equired	Locus from which the variable domain in recep-
			tor_variable_domain_1_aa originates
receptor_variable	stomagin_2_aa	required	Complete amino acid sequence of the mature variable
			domain of the Ig light, TCR alpha or TCR gamma chain.
			The mature variable domain is defined as encompassing
			all AA from and including first AA after the the signal
			peptide to and including the last AA that is completely encoded by the J gene.
receptor_variable	stomanin 2 loc	u s equired	Locus from which the variable domain in recep-
receptor_variable		usequireu	tor_variable_domain_2_aa originates
receptor_ref	array of string	optional, nul-	Array of receptor identifiers defined for the Receptor ob-
	,	lable	ject
reactivity_measur	emeny of object	optional, nul-	Records of reactivity measurement
		lable	

2.3.3 AIRR Software WG - Guidance for AIRR Software Tools

Version 1.0

AIRR Software WG - Compliance Checklist for AIRR Software Tools

Version 1.0 (when finalised)

This questionnaire should be read in conjunction with the AIRR Software WG - Guidance for AIRR Software Tools.

To submit your tool for ratification against the standard, please send the completed questionnaire to software@airrc.antibodysociety.org.

Please provide comments in italics in each response box where these would be helpful to facilitate understanding. We kindly ask for a brief explanatory comment if your answer to a question is *no* or *not applicable*.

Name of Tool:

Brief description of Tool:

Contact Name/Institution:

Contact email:

Re- quire- ment Ref.	Question	Response
1	Where is the source code published (please provide a link)?	
2	Does the tool support AIRR Data Representations standards?	yes/no
	Please list any other standard data formats that are supported	
3	Does the distribution include example data?	yes/no
	Is the example data in MiAIRR format, where applicable?	yes/no/not applicable
	Does the tool provide automated checks for expected output from example	yes/no
	data?	
4	Does the output of the tool include a summary of the run parameters?	yes/no
5	Is a container build file provided?	yes/no
	Container technology used?	Docker/Singularity/Othe
	Is the container automatically built as new versions are released?	(please specify)
	Does the automated build run the tool against the example data and test the	yes/no
	output?	yes/no
6	Where can users see what level of support is available? (Please provide a link)	
7	Under what software licence is the tool published? (please provide the name	
	of the licence (e.g. GPL, MIT) or a link	

AIRR Software WG - List of Tools Certified as Compliant

The following tools have been certified as compliant with v1.0 of the guidelines:

Software	Version	Support	Reference
SONAR	3	Output	Schramm et al. Front Immunol,
			2016.
ImmuneDB	0.29.10	Input	Rosenfeld et al. Front Immunol,
			2018,
Scirpy	0.4.2	Input	Sturm et al. Bioinformatics,
			2020,
Immcantation	4	Input, Output	Vander Heiden et al. Bioin-
Framework			formatics, 2014,; Gupta et al.,
			Bioinformatics, 2015,
CompAIRR	1.3.1	Input	Rognes T, Scheffer L, Greiff
			V, Sandve GK, BioRxiv, 2021
			(preprint),
ImmuneML	2.0.4	Input, Output	Pavlovic et al., BioRxiv, 2021
			(preprint),
Dandelion	0.1.10	Output	Stephenson et al., Nature
			Medicine, 2021,

Evaluation Data Sets

The Software WG is working on the development and evaluation of simulated data sets.

Lists of published real-world datasets are maintained in the AIRR Forum Wiki.

Introduction

The Adaptive Immune Receptor Repertoire (AIRR) Community will benefit greatly from cooperation among groups developing software tools and resources for AIRR research. The goal of the AIRR Software Working Group is to promote standards for AIRR software tools and resources in order to enable rigorous and reproducible immune repertoire research at the largest scale possible. As one contribution to this goal, we have established the following standards for software tools. Authors whose tools comply with this standard will, subject to ratification from the AIRR Software WG, be permitted to advertise their tools as being AIRR-compliant.

Requirements

Tools must:

- 1. Be published in source code form, and hosted on a publicly available repository with a clear versioning system.
- 2. Support community-curated standard file formats and strive for modularity and interoperability with other tools. In particular, tools must read and write *AIRR Data Representations* standards corresponding to their tool.
- 3. Include example data (in AIRR standard formats where applicable) and an automated check for expected output from that data, in order to provide a minimal example of functionality allowing users to check that the software is performing as described.
- 4. Provide information about run parameters as part of the output.
- 5. Provide a container build file that can be used to create an image which encapsulates the software tool, its dependencies, and required run environment. This needs to be remotely and automatically built. The build should conclude by running the example data through the tool (see point 3) and confirming that the expected output is obtained. We currently recognize two software solutions, although we will adapt as software evolves:
 - a. A Dockerfile that automatically builds a container image on Docker Hub.
 - b. A Singularity recipe file that automatically builds a container image on Singularity Hub.
- 6. Provide user support, clearly stating which level of support users can expect, and how and from whom to obtain it.

Recommendations

We suggest software tools be published under a license that permits free access, use, modification, and sharing, such as GPL, Apache 2.0, or MIT. However, we understand that this depends on institutional intellectual property restrictions, thus it is a recommendation rather than a requirement.

Explanatory Notes

Open Source Software and Versioned Repositories

Software tools in the AIRR field are evolving rapidly. In the interests of reproducibility and transparency, published work should be based on tools (and versions of tools) that can be obtained easily by other researchers in the future. To that end, AIRR compliant tools must be published in open repositories such as GitHub or Bitbucket, and we encourage publishing users to provide specifics on the version and configuration of tools that have been employed.

Community-Curated File Formats

The AIRR Data Representation Working Group has defined standards for immune receptor repertoire sequencing datasets. Software tool authors are requested to support these standards as much as possible, for applicable data sets. The currently implemented standard covers submission of reads to NCBI repositories (BioProject, BioSample, SRA and Genbank) and annotated immune receptor rearrangements. Tool authors can assist by easing/guiding the process of submission as much as possible.

Example Data and Checks

Because the installation and operation of the tools in this field may be complex, we require example data and details of expected output, so that users can confirm that their installation is functioning as expected. Furthermore, metadata (for example, germline gene libraries) and other software dependencies should be checked when the tool runs, and informative error messages issued if necessary. A means should be provided to check the expected output automatically.

Dependencies and Containers

Containers encapsulate everything needed to run a piece of software into a single convenient executable that is largely independent of the user's software environment. For the following purposes, providers of AIRR-compliant tools must provide a containerized implementation (based on a published build script as described above) as one download option that users can choose:

- Containers allow users to use and evaluate a tool easily and reproduce results, without the need to resolve dependencies or configure the environment.
- Having these containers be automatically built also provides a self-validated way to understand the fine details of installation from a known starting point.

To ensure that containers are up to date, they must be built automatically when the current release version of the tool is updated. We will use automated builds on Docker Hub and Singularity Hub for this purpose. The corresponding build files document dependencies clearly, and make it easy for the maintainer to keep the container's dependencies up to date in subsequent releases.

An example Docker container is provided on the Software WG Github Repository. This example encapsulates Ig-BLAST, and implements the bioboxes command-line standard.

Support Statements

Tool authors must provide support for the tool. They must state explicitly what level of support is provided, and explain how support can be obtained. We recommend a method such as the issues tracker on Github, that publishes support requests transparently and links resolutions to specific versions or releases. Users are advised to check that the level of support and the frequency of software updates matches their expectations before committing to a tool.

Analysis Workflows

- At the moment, we do not endorse a specific workflow technology standard:
 - Technology is evolving too rapidly for us to commit to a particular workflow.
 - Typically, AIRR analysis tools have many options and modes, which would make it difficult to support a "plug and play" environment without unduly restricting functionality.
- As tools and workflows evolve, we will keep the position under review and may make stronger technology recommendations in the future.
- We strongly encourage authors of tools to provide concrete, documented, examples of workflows that employ their tools, together with sample input and output data.
- Likewise we encourage authors of research publications to provide documented workflows that will enable interested readers to reproduce the results.

Ratification

Authors may submit tools to the AIRR Software WG requesting ratification against the standard. The submitter should provide a completed copy of the *AIRR Software WG - Compliance Checklist for AIRR Software Tools* to evidence reviewable and itemised evidence of compliance with each Requirement listed above.

The Software WG will, where appropriate, issue a Certificate of Compliance, stating the version of the tool reviewed and the version of the Standard with which compliance was ratified. After receiving a Certificate, authors will be entitled to claim compliance with the Standard, and may incorporate any artwork provided by AIRR for that purpose.

The Software WG will maintain and publish a list of compliant software.

If a tool does not achieve ratification, the Software WG will provide an explanation. The Software WG encourages resubmission once issues have been resolved.

Authors must re-submit tools for ratification following major upgrades or substantial modifications. The Software WG may, at its discretion, request resubmission at any time. If a certified tool subsequently fails ratification, or is not re-submitted in response to a request from the Software WG, AIRR compliance may no longer be claimed and the associated artwork may no longer be used.

The Software WG may, at its discretion, issue a new version of this standard at any time. Tools certified against previous version(s) of the standard may continue to claim compliance with those versions and to use the associated artwork. Authors wishing to claim compliance with the new version must submit a new request for certification and may not claim compliance with the new version, or use associated artwork, until and unless certification is obtained.

2.3.4 AIRR Data Commons API V1

The use of high-throughput sequencing for profiling B-cell and T-cell receptors has resulted in a rapid increase in data generation. It is timely, therefore, for the Adaptive Immune Receptor Repertoire (AIRR) community to establish a clear set of community-accepted data and metadata standards; analytical tools; and policies and practices for infrastructure to support data deposit, curation, storage, and use. Such actions are in accordance with international funder and journal policies that promote data deposition and data sharing – at a minimum, data on which scientific publications are based should be made available immediately on publication. Data deposit in publicly accessible databases ensures that published results may be validated. Such deposition also facilitates reuse of data for the generation of new hypotheses and new knowledge.

The AIRR Common Repository Working Group (CRWG) developed a set of recommendations (v0.7.0) that promote the deposit, sharing, and use of AIRR sequence data. These recommendations were refined following community discussions at the AIRR 2016 and 2017 Community Meetings and were approved through a vote by the AIRR Community at the AIRR Community Meeting in December 2017.

Overview

The AIRR Data Commons (ADC) API provides programmatic access to query and download AIRR-seq data. The ADC API uses JSON as its communication format, and standard HTTP methods like GET and POST. The ADC API is read-only and the mechanism of inclusion of AIRR-seq studies into a data repository is left up to the repository.

This documentation explains how to construct and execute API requests and interpret API responses.

API Endpoints

The ADC API is versioned with the version number (v1) as part of the base path for all endpoints. Each ADC API endpoint represents specific functionality as summarized in the following table:

Endpoint	Туре	HTT	PDescription
/v1	Service status	GET	Returns success if API service is running.
/v1/info	Service information	GET	Upon success, returns service information such as name, version, etc.
<pre>/v1/ repertoire/ {repertoire_id}</pre>	Retrieve a repertoire given its repertoire_id	GET	Upon success, returns the Repertoire information in JSON according to the <i>Repertoire schema</i> .
/v1/repertoire	Query repertoires	POST	Upon success, returns a list of Repertoires in JSON according to the <i>Repertoire schema</i> .
<pre>/v1/ rearrangement/ {sequence_id}</pre>	Retrieve a rearrangement given its sequence_id	GET	Upon success, returns the Rearrangement information in JSON format according to the <i>Rearrangement schema</i> .
/v1/ rearrangement	Query rearrangements	POST	Upon success, returns a list of Rearrangements in JSON or AIRR TSV format according to the <i>Rearrangement schema</i> .
/v1/clone/ {clone_id}	Retrieve a Clone given its clone_id	GET	Upon success, returns the Clone information in JSON format according to the <i>Clone schema</i> .
/v1/clone	Query clones	POST	Upon success, returns a list of Clones in JSON format according to the <i>Clone schema</i> .
/v1/cell/ {cell_id}	Retrieve a Cell given its cell_id	GET	Upon success, returns the Cell information in JSON for- mat according to the <i>Cell schema</i> .
/v1/cell	Query cells	POST	Upon success, returns a list of Cells in JSON format according to the <i>Cell schema</i> .
<pre>/v1/ expression/ {expression_id}</pre>	Retrieve a Expression Property given its expression_id	GET	Upon success, returns the Expression information in JSON format according to the <i>CellExpression schema</i> .
/v1/expression	Query Cell Expression properties	POST	Properties in JSON format according to the <i>CellExperssion schema</i> .
<pre>/v1/receptor/ {receptor_id}</pre>	Retrieve a Receptor given its receptor_id	GET	Upon success, returns the Receptor information in JSON format according to the <i>Receptor schema</i> .
/v1/receptor	Query Receptor properties	POST	Upon success, returns a list of Receptors in JSON for- mat according to the <i>Receptor schema</i> .

Repository implementation principles

Implementers of the ADC API should follow the following high level principles. Users of the ADC API can expect the following principles to be followed.

- All API endpoints should return JSON encodings as an API repsonse.
- For some API endpoints it is possible to request TSV files, and those endpoints that support TSV files are documented here (see above).
- Endpoints that are not documented as supporting TSV can reject TSV requests.
- If an API endpoint returns a field, then the content of that field in the JSON and TSV response must be equivalent.

Authentication

The ADC API currently does not define an authentication method. Future versions of the API will provide an authentication method so data repositories can support query and download of controlled-access data.

Search and Retrieval

The AIRR Data Commons API specifies endpoints for searching and retrieving AIRR-seq data sets stored in an AIRRcompliant Data Repository according to the AIRR Data Model. This documentation describes Version 1 of the API. The general format of requests and associated parameters are described below.

The design of the AIRR Data Commons API was greatly inspired by National Cancer Institute's Genomic Data Commons (GDC) API.

Components of a Request

The ADC API has two classes of endpoints. The endpoints that respond to GET requests are simple services that require few or no parameters. While, the endpoints that response to POST requests are the main query services and provide many parameters for specifying the query as well as the data in the API response.

A typical POST query request specifies the following parameters:

- The filters parameter specifies the query.
- The from and size parameters specify the number of results to skip and the maximum number of results to be returned in the response.
- The fields parameter specifies which data elements to be returned in the response. By default all fields (AIRR and non-AIRR) stored in the data repository are returned. This can vary between data repositories based upon how the repository decides to store blank or null fields, so the fields and/or include_fields parameter should be used to guarantee the existence of data elements in the response.
- The include_fields parameter specifies the set of AIRR fields to be included in the response. This parameter can be used in conjunction with the fields parameter, in which case the list of fields is merged. This is a mechanism to ensure that specific, well-defined sets of AIRR data elements are returned without requiring all of those fields to be individually provided in the fields parameter.

The sets that can be requested are summarized in the table below.

include_fields	MiAIRR	AIRR required	AIRR identifiers	other AIRR fields
miairr	Y	some	Ν	Ν
airr-core	Y	Y	Y	Ν
airr-schema	Y	Y	Y	Y

Service Status Example

The following is an example GET request to check that the service API is available for VDJServer's data repository.

curl https://vdjserver.org/airr/v1

The response should indicate success.

{"result":"success"}

Service Info Example

The following is an example GET request to get information about the service.

curl https://vdjserver.org/airr/v1/info

The response provides various information.

}
```

The response contains two JSON objects, an Info object that provides information about the API response and a Repertoire object that contains the list of Repertoires that met the query search criteria. In this case, the query returns a list of five repertoire identifiers. Note the Info object is based on the info block as specified in the OpenAPI v2.0 specification.

Endpoints

The ADC API V1 provides two primary endpoints for querying and retrieving AIRR-seq data. The repertoire endpoint allows querying upon any field in the *Repertoire schema* including study, subject, sample, cell processing, nucleic acid processing, sequencing run, raw sequencing files, and data processing information. Queries on the content of raw sequencing files is not support but is supported on file attributes such as name, type and read information. Queries on Rearrangements is provided by the rearrangement endpoint.

The standard workflow to retrieve all of the data for an AIRR-seq study involves performing a query on the repertoire endpoint to retrieve the repertoires in the study, and one or more queries on the rearrangement endpoint to download the rearrangement data for each repertoire. The endpoints are designed so the API response can be saved directly into a file and be used by AIRR analysis tools, including the AIRR python and R reference libraries, without requiring modifications or transformation of the data.

Repertoire Endpoint

The **repertoire** endpoint provides access to all fields in the *Repertoire schema*. There are two type of endpoints; one for retrieving a single repertoire given its identifier, and another for performing a query across all repertoires in the data repository.

It is expected that the number of repertoires in a data repository will never become so large such that queries become computationally expensive. A data repository might have thousands of repertoires across hundreds of studies, yet such numbers are easily handled by modern databases. Based upon this, the ADC API does not place limits on the repertoire endpoint for the fields that can be queried, the operators that can be used, or the number of results that can be returned.

Retrieve a Single Repertoire

Given a repertoire_id, a single Repertoire object will be returned.

curl https://vdjserver.org/airr/v1/repertoire/5993695857891348971-242ac118-0001-012

The response will provide the Repertoire data in JSON format.

"study_description": "Cervical cancer is the fourth most common cancer and \rightarrow fourth leading cause of cancer death among women worldwide. In low Human Development \rightarrow Index settings, it ranks second. Screening and surveillance involve the cytology-based --Papanicolaou (Pap) test and testing for high-risk human papillomavirus (hrHPV). The $_{
m o}$ Pap test has low sensitivity to detect precursor lesions, while a single hrHPV test \rightarrow cannot distinguish a persistent infection from one that the immune system will \rightarrow grade cervical lesions, testing cannot identify the ~20% who would progress to cancer \rightarrow if not treated. Thus, reliable detection and treatment of cancers and precancers \rightarrow requires routine screening followed by frequent surveillance among those with past \rightarrow abnormal or positive results. The consequence is overtreatment, with its associated \rightarrow risks and complications, in screened populations and an increased risk of cancer in \rightarrow under-screened populations. Methods to improve cervical cancer risk assessment, \rightarrow particularly assays to predict regression of precursor lesions or clearance of hrHPV \rightarrow infection, would benefit both populations. Here we show that women who have lower risk \rightarrow results on follow-up testing relative to index testing have evidence of enhanced T \rightarrow cell clonal expansion in the index cervical cytology sample compared to women who \rightarrow persist with higher risk results from index to follow-up. We further show that a \rightarrow machine learning classifier based on the index sample T cells predicts this transition \rightarrow to lower risk with 95% accuracy (19/20) by leave-one-out cross-validation. Using T_{\rightarrow} \rightarrow cell receptor deep sequencing and machine learning, we identified a biophysicochemical \rightarrow motif in the complementarity-determining region 3 of T cell receptor chains whose \rightarrow presence predicts this transition. While these results must still be tested on an \rightarrow independent cohort in a prospective study, they suggest that this approach could \rightarrow improve cervical cancer screening by helping distinguish women likely to spontaneously. \rightarrow regress from those at elevated risk of progression to cancer. The advancement of such \rightarrow a strategy could reduce surveillance frequency and overtreatment in screened --populations and improve the delivery of screening to under-screened populations.",

"inclusion_exclusion_criteria": "We included samples from White Hispanic women_ \rightarrow age 18 years or older. We excluded women who were HIV+, pregnant, had an intrauterine \rightarrow device, or had a sexually transmitted disease at the time of sample collection. We --obtained samples across all cytology result categories: Negative for Intraepithelial -Lesion or Malignancy (NILM, Normal), Abnormal Squamous Cells of Undetermined -Significance (ASCUS), Low-grade Squamous Intraepithelial Lesion (LSIL), and High-grade \rightarrow the primary screening strategy is cytology alone with a reflex hrHPV test for women $_{
m o}$ with an ASCUS cytology result. The test assays for positivity across 14 HPV types, and \rightarrow the ASCUS result category is divided into ASCUS/HPV- (negative for all 14 types) and \rightarrow ASCUS/HPV+ (positive for at least one type). An additional exclusion criterion was →applied to women with a result of Normal, ASCUS/HPV-, and ASCUS/HPV+, and that is they \rightarrow were excluded if they had previously had cervical cancer or previous treatment of \rightarrow cervical pre-cancerous lesions.\n\nWe applied these inclusion and exclusion criteria \rightarrow in a quota sampling scheme to ensure adequate representation of women across all five \rightarrow result categories. We targeted a minimum of 100 samples total with a minimum of 15 $_{
m samples}$ in each category, and then rescued all samples meeting our criteria each week →until all minimums were reached.",

Query against all Repertoires

A query in JSON format is passed in a POST request. This example queries for repertoires of human IG heavy chain receptors for all studies in the data repository.

```
curl --data @query2_repertoire.json -H 'content-type: application/json' https://
→vdjserver.org/airr/v1/repertoire
```

The content of the JSON payload.

```
"value":"IGH"
}
]
}
}
```

The response will provide a list of Repertoires in JSON format. The example output is not provided here due to its size.

Rearrangement Endpoint

The rearrangement endpoint provides access to all fields in the *Rearrangement schema*. There are two type of endpoints; one for retrieving a single rearrangement given its identifier, and another for performing a query across all rearrangements in the data repository.

Unlike repertoire data, data repositories are expected to store millions or billions of rearrangement records, where performing "simple" queries can quickly become computationally expensive. Data repositories will need to optimize their databases for performance. Therefore, the ADC API does not require that all fields be queryable and only a limited set of query capabilities must be supported. The queryable fields are described in the Fields section below.

Retrieve a Single Rearrangement

Given a sequence_id, a single Rearrangement object will be returned.

```
curl https://vdjserver.org/airr/v1/rearrangement/610b77f6d5812c007f79bba3
```

The response will provide the Rearrangement data in JSON format.

```
{
  "Info":
  {
      "title": "AIRR Data Commons API reference implementation",
      "description": "API response for rearrangement query",
      "version": 1.3,
      "contact":
      {
          "name": "AIRR Community",
          "url": "https://github.com/airr-community"
      }
  },
  "Rearrangement":
  Ε
    {
      "sequence_id":"610b77f6d5812c007f79bba3",
      "repertoire_id":"5993695857891348971-242ac118-0001-012",
      "data_processing_id": "bf0617e7-b4a4-480f-99e3-b53eef9ca6d4-007",
      "... remaining fields":"snipped for space"
    }
  ]
}
```

Query against all Rearrangements

Supplying a repertoire_id, when it is known, should greatly speed up the query as it can significantly reduce the amount of data to be searched, though it isn't necessary.

This example queries for rearrangements with a specific junction amino acid sequence among a set of repertoires. A limited set of fields is requested to be returned. The resultant data can be requested in JSON or *AIRR TSV* format.

```
curl --data @query1_rearrangement.json -H 'content-type: application/json' https://
→vdjserver.org/airr/v1/rearrangement
```

The content of the JSON payload.

```
{
    "filters":{
        "op":"and",
        "content": [
            {
                 "op":"in",

```

Clone Endpoint

The clone endpoint provides access to all fields in the *Clone schema*. There are two type of endpoints; one for retrieving a single clone given its identifier, and another for performing a query across all clones in the data repository.

Unlike repertoire data, data repositories are expected to store millions or billions of clone records, where performing "simple" queries can quickly become computationally expensive. Data repositories will need to optimize their databases for performance. Therefore, the ADC API does not require that all fields be queryable and only a limited set of query capabilities must be supported. The queryable fields are described in the Fields section below.

Retrieve a Single Clone

Given a clone_id, a single Clone object will be returned.

```
curl https://covid19-1.ireceptor.org/airr/v1/clone/{clone_id}
```

Where clone_id is the ID of a clone object in the repository. The response will provide the Clone data in JSON format.

```

```

Query against all Clones

Supplying a repertoire_id, when it is known, should greatly speed up the query as it can significantly reduce the amount of data to be searched, though it isn't necessary.

This example queries for clones with a specific junction amino acid sequence among a set of repertoires. A limited set of fields is requested to be returned. The resultant data is provided in JSON format.

This query searches the repository for clones that have a specific junction_aa field with a value of CARAHCSWGSSRFGAFDMW and requests only a single object in the response ("size":1). The response would be similar to that provided by the single clone query given above.

Cell Endpoint

The cell endpoint provides access to all fields in the *Cell schema*. There are two type of endpoints; one for retrieving a single cell given its identifier, and another for performing a query across all cells in the data repository.

Unlike repertoire data, data repositories are expected to store millions of cell records, where performing "simple" queries can quickly become computationally expensive. Data repositories will need to optimize their databases for performance. Therefore, the ADC API does not require that all fields be queryable and only a limited set of query capabilities must be supported. The queryable fields are described in the Fields section below.

Retrieve a Single Cell

Given a cell_id, a single Cell object will be returned.

curl https://covid19-1.ireceptor.org/airr/v1/cell/{cell_id}

Where cell_id is the ID of a cell object in the repository. The response will provide the Cell data in JSON format.

```

```

Query against all Cells

Supplying a repertoire_id, when it is known, should greatly speed up the query as it can significantly reduce the amount of data to be searched, though it isn't necessary.

This example queries for clones with a specific junction amino acid sequence among a set of repertoires. A limited set of fields is requested to be returned. The resultant data is provided in JSON format.

This query searches the repository for cells that have a specific repertoire_id field with a value of PRJCA002413-ERS1-CELL and requests only a single object in the response ("size":1). The response would be similar to that provided by the single cell query given above.

Expression Endpoint

The expression endpoint provides access to all fields in the *CellExpression schema*. There are two type of endpoints; one for retrieving a single expression property given its identifier, and another for performing a query across all expression properties in the data repository.

Unlike repertoire data, data repositories are expected to store millions or billions of cell expression records, where performing "simple" queries can quickly become computationally expensive. Data repositories will need to optimize their databases for performance. Therefore, the ADC API does not require that all fields be queryable and only a limited set of query capabilities must be supported. The queryable fields are described in the Fields section below.

Retrieve a Cell Expression Property

Given a expression_id, a single Expression object will be returned.

```
curl https://covid19-1.ireceptor.org/airr/v1/expression/{expression_id}
```

Where expression_id is the ID of an expression object in the repository. The response will provide the CellExpression data in JSON format.

```
{"Info":{
  "title": "airr-api-ireceptor",

  }.
  "value": 1
}]}
```

Query against all Cell Expression data

Supplying a repertoire_id or cell_id, when it is known, should greatly speed up the query as it can significantly reduce the amount of data to be searched, though it isn't necessary.

This example queries for cell expression data with an ENSEMBL gene ID with the value ENSG: ENSG0000017575 and

requests only a single object response ("size":1). The resultant data is provided in JSON format and would be similar to that provided by the single expression property query given above.

Receptor Endpoint

The receptor endpoint provides access to all fields in the *Receptor Schema (Experimental)*. There are two type of endpoints: One for retrieving a single receptor given its identifier, and another for performing a query across all receptors in the data repository.

To allow data repositories to optimize their databases for performance, the ADC API does not require that all fields in the **Receptor** object to be queryable and only a limited set of query capabilities must be supported. The queryable fields are described in the Fields section below.

Retrieve a Receptor

Given a receptor_id, a single Receptor object will be returned.

curl https://covid19-1.ireceptor.org/airr/v1/receptor/{receptor_id}

Where receptor_id is the ID of a Receptor object in the repository. The response will provide the object in JSON format.

```

Query against all Receptor data

This example queries for receptor data that has a TCR receptor type and requests only a single object response ("size":1). The resultant data is provided in JSON format and would be similar to that provided by the single expression property query given above.

Request Parameters

The ADC API supports the follow query parameters. These are only applicable to the query endpoints, i.e. the HTTP POST endpoints.

Parameter	Default	Description
filters	null	Specifies logical expression for query critieria
format	JSON	Specifies the API response format: JSON, AIRR TSV
include_fields	null	Specifies the set of AIRR fields to be included in the response
fields	null	Specifies which fields to include in the response
from	0	Specifies the first record to return from a set of search results
size	repository dependent	Specifies the number of results to return
facets	null	Provide aggregate count information for the specified fields

Filters Query Parameter

The filters parameter enables passing complex query criteria to the ADC API. The parameter represents the query in a JSON object.

A filters query consists of an operator (or a nested set of operators) with a set of field and value operands. The query criteria as represented in a JSON object can be considered an expression tree data structure where internal nodes are operators and child nodes are operands. The expression tree can be of any depth, and recursive algorithms are typically used for tree traversal.

The following operators are support by the ADC API.

Op-	Operan	dsValue	Description	Example
er-		Data		
a-		Types		
tor				
=	field	string,	equals	{"op":"=","content":{"field":"junction_aa","value":"CASSYIKLN"}}

	opera-			{"op":"exclude", "content":{"field":"subject.strain_name", "value":["SCID", "NOD
1				, and the second of the state of the second and the second of the second s

Note that the not operator is different from a logical NOT operator, and the logical NOT is not needed as the other operators provide negation.

The field operand specifies a fully qualified property name in the AIRR Data Model. Fully qualified AIRR properties are either a JSON/YAML base type (string, number, integer, or boolean) or an array of one of these base types (some AIRR fields are arrays e.g. study.keywords_study). The Fields section below describes the available queryable fields.

The value operand specifies one or more values when evaluating the operator for the field operand.

Queries Against Arrays

A number of fields in the AIRR Data Model are arrays, such as study.keywords_study which is an array of strings or subject.diagnosis which is an array of Diagnosis objects. A query operator on an array field will apply that operator to each entry in the array to decide if the query filter is satisfied. The behavior is different for various operators. For operators such as = and in, the filter behaves like the Boolean OR over the array entries, that is if **any** array entry evaluates to true then the query filter is satisfied. For operators such as != and exclude, the filter behaves like the Boolean AND over the array entries, that is **all** array entries must evaluate to true for the query filter to be satisfied.

Examples

A simple query with a single operator looks like this:

```
{
  "filters": {
    "op":"=",
    "content": {
        "field":"junction_aa",
        "value":"CASSYIKLN"
    }
}
```

A more complex query with multiple operators looks like this:

```
{
  "filters": {
    "op":"and",
    "content": [
      {
        "op":"!=".
        "content": {
          "field":"subject.organism.id",
          "value":"9606"
        }
      },
      {
        "op":">=",
        "content": {
          "field":"sample.cells_per_reaction",
          "value":"10000"
        }
      },
      {
        "op":"exclude",
        "content": {
          "field": "subject.organism.id",
```

```
"value": ["9606", "10090"]
}
}
]
}
```

Format Query Parameter

}

Specifies the format of the API response. json is the default format and is available for all endpoints. The rearrangement POST endpoint also accepts tsv which will provide the data in the *AIRR TSV* format. A specific ordering of fields in the TSV format should not be assumed from one API request to another. Take care to properly merge AIRR TSV data from multiple API requests, e.g. such as with the airr-tools merge program.

Fields Query Parameter

The fields parameter specifies which fields are to be included in the API response. By default all fields (AIRR and non-AIRR) stored in the data repository are returned. However, this can vary between data repositories based upon how the repository decides to store blank or null fields, so the fields and/or include_fields parameter should be used to guarantee the existence of data elements in the response.

Include Fields Query Parameter

The include_fields parameter specifies that the API response should include a well-defined set of AIRR Standard fields. These sets include:

- miairr, for only the MiAIRR fields.
- airr-core, for the AIRR required and identifier fields. This is expected to be the most common option as it provides all MiAIRR fields, additional required fields useful for analysis, and all identifier fields for linking objects in the AIRR Data Model.
- airr-schema, for all AIRR fields in the AIRR Schema.

The include_fields parameter is a mechanism to ensure that specific AIRR data elements are returned without requiring those fields to be individually provided with the fields parameter. Any data elements that lack a value will be assigned null in the response. Any empty array of objects, for example subject.diagnosis, will be populated with a single object with all of the object's properties given a null value. Any empty array of primitive data types, like string or number, will be assigned null. Note that if both the include_fields and the fields parameter are provided, the API response will include the set of AIRR fields and in addition will include any additional fields that are specified in the fields parameter.

Size and From Query Parameters

The ADC API provides a pagination feature that limits the number of results returned by the API.

The from query parameter specifies which record to start from when returning results. This allows records to be skipped. The default value is 0 indicating that the first record in the set of results will be returned.

The size query parameters specifies the maximum number of results to return. The default value is specific to the data repository, and a maximum value may be imposed by the data repository. This is to prevent queries from "accidently" returning millions of records. The info endpoint provides the data repository default and maximum values for the repertoire and rearrangement endpoints, which may have different values. A value of **0** indicates there is no limit on the number of results to return, but if the data repository does not support this then the default value will be used.

The combination of from and size can be used to implement pagination in a graphical user interface, or to split a very large download into smaller batches. For example, if an interface displays 10 records as a time, the request would assign size=10 and from=0 to get the ten results to display on the first page. When the user traverses to the "next page", the request would assign from=10 to skip the first ten results and return the next ten results, and from=20 for the next page after that, and so on.

Facets Query Parameter

{

}

The facets parameter provides aggregate count information for the specified field. Only a single field can be specified. The facets parameter can be used in conjunction with the filters parameter to get aggregate counts for a set of search results. It returns the set of values for the field, and the number of records (repertoires or rearrangement) that have this value. For field values that have no counts, the API service can either return the field value with a 0 count or exclude the field value in the aggregation. The typical use of this parameter is for displaying aggregate information in a graphical user interface.

Here is a simple query with only the facets parameter to return the set of values for sample.pcr_target. pcr_target_locus and the count of repertoires repertoires that have each value. The content of the JSON payload.

```
"facets":"sample.pcr_target.pcr_target_locus"
```

Sending this query in an API request.

```
curl --data @facets1_repertoire.json -H 'content-type: application/json' https://
→vdjserver.org/airr/v1/repertoire
```

The output from the request is similar to normal queries except the data is provided with the Facet key.

```
{
 "Info": {
    "title": "AIRR Data Commons API for VDJServer Community Data Portal",
    "description": "VDJServer ADC API response for repertoire query",
    "version": "1.3",
    "contact": {
      "name": "VDJServer",
      "url": "http://vdjserver.org/",
      "email": "vdjserver@utsouthwestern.edu"
   }
 },
 "Facet": [
   {
      "sample.pcr_target.pcr_target_locus": "TRB",
      "count": 2786
   },
    {
      "sample.pcr_target.pcr_target_locus": "TRA",
      "count": 242
   },
    {
      "sample.pcr_target.pcr_target_locus": "IGK",
      "count": 122
    }.
    {
      "sample.pcr_target.pcr_target_locus": "IGH",
      "count": 547
   },
    {
      "sample.pcr_target.pcr_target_locus": "IGL",
      "count": 121
   }
```

}

Here is a query with both filters and facets parameters, which restricts the data records used for the facets count. The content of the JSON payload.

```
{
    "filters":{
        "op":"and",
        "content": [
            {
                 "op":"=",
                 "content": {
                     "field":"study.study_id",
                     "value":"PRJNA300878"
                 }
            },
            {
                 "op":"=",
                 "content": {
                     "field":"sample.pcr_target.pcr_target_locus",
                     "value":"IGH"
                 }
            }
        1
    },
    "facets":"subject.subject_id"
}
```

Sending this query in an API request.

```
curl --data @facets2_repertoire.json -H 'content-type: application/json' https://
_-vdjserver.org/airr/v1/repertoire
```

Example output from the request. This result indicates there are ten subjects each with two IGH repertoires.

ADC API Limits and Thresholds

Repertoire endpoint query fields

}

It is expected that the number of repertoires in a data repository will never become so large such that queries become computationally expensive. A data repository might have thousands of repertoires across hundreds of studies, yet such numbers are easily handled by databases. Based upon this, the ADC API does not place limits on the repertoire endpoint for the fields that can be queried or the operators that can be used.

Rearrangement endpoint query fields

Unlike repertoire data, data repositories are expected to store billions of rearrangement records, where performing "simple" queries can quickly become computationally expensive. Data repositories are encouraged to optimize their databases for performance. Therefore, based upon a set of query use cases provided by immunology experts, a minimal set of required fields was defined that can be queried. These required fields are described in the following Table. The fields also have the AIRR extension property adc-query-support: true in the AIRR Schema.

Field(s)	Description
sequence_id, reper-	Identifiers; sequence_id allows for query of that specific rearrangement object in the
toire_id, sam-	repository, while repertoire_id, sample_processing_id, and data_processing_id are links
ple_processing_id,	to the repertoire metadata for the rearrangement. The clone_id and cell_id are identifiers
data_processing_id,	that group rearrangements based on clone assignment and single cell assignment.
clone_id, cell_id	
locus, v_call, d_call,	Commonly used rearrangement annotations.
j_call, c_call, produc-	
tive, junction_aa, junc-	
tion_aa_length	

Data repository specific limits

A data repository may impose limits on the size of the data returned. This might be because of limitations imposed by the back-end database being used or because of the need to manage the load placed on the server. For example, MongoDB databases have document size limits (16 megabytes) which limit the size of a query that can be sent to a repository and the size of a single repertoire or rearrangement object that is returned. As a result a repository might choose to set a maximum query size.

Size limits can be retrieved from the info endpoint. If the data repository does not provide a limit, then no limit is assumed.

Field	Description
<pre>max_siz</pre>	e The maximum value for the size query parameter. Attempting to retrieve data beyond this maximum
	should trigger an error response. The error response should include information about why the query
	failed and what the maximum size limit is.
max_que	r The inze ximum size of the JSON query object.

Reference Implementation

The AIRR Community provides a reference implementation for an ADC API service with more information found *here*.

2.3.5 AIRR Ontologies and Vocabularies Sub-WG

Summary

The "Ontologies and Vocabularies Team" was initial formed as a joint interest group of the Common Repository (Com-Repo) and the Minimal Standards (MiniStd) working groups (WG) of the AIRR Community. When the two WG merged into the current Standards WG in Decemmber 2020, OntoVoc became a Sub-WG of it. The long-term aim of the Sub-WG is to define standard vocabularies and ontologies to be used by AIRR-compliant repositories.

Ontology Data Representation

The nodes in an ontology are typically either concepts (e.g., capital) or instances thereof (e.g., Paris). These nodes have *local IDs* (often numbers), which are unique within an ontology. They also typically have *labels*, which is the human-readable name of the node. Ontology entities in the AIRR Data Standard reflect this model, with each AIRR field that is represented as an ontology recorded with a global *ontology ID* (id) and the corresponding *label* (label).

Within the AIRR Standards, Compact URIs (CURIEs) are used to represent *ontology IDs* or *persistent IDs*. CURIEs are a standardized way to abbreviate International Resource Identifiers (IRI, [RFC3987]), which include URIs and URLs as subsets. They were originally conceived to simplify the handling of attributes, e.g., in XML or SPARQL, by making them more compact and readable. CURIEs are also used by IEDB databases to reduce redundancies (mainly in the leading part of IRIs).

For example, a typical CURIE would look like NCBITAXON:9258. In this case, NCBITAXON is the *prefix*, a custom string that will be replaced by a repository-defined IRI component (e.g., http://purl.obolibrary.org/obo/NCBITaxon_). Note that there is no connection between NCBITAXON in the CURIE and NCBITaxon in the IRI, the former one is just a placeholder. Although common, it is not always the case that a resolved CURIE (the IRI *prefix* plus the *local ID*) can be used as a URL directly to look up the CURIE using a web browser.

The AIRR Schema provides a CURIEMap, a list of AIRR approved CURIE *prefixes* along with a map of at least one iri_prefix (i.e., a replacement string to construct the complete IRI) for each *prefix*. As the iri_prefix might differ between *provider*-specific implementations of an ontology (e.g., NCBI Taxonomy), the CURIEMap supports multiple iri_prefix entries for a given *prefix*. Finally, the CURIEMap should also provide a default map and provider for each *prefix*. Complementary to this, the InformationProvider list describes the mechanism to computationally look up a resolved IRI (e.g., the iri_prefix and the *local ID*) by specifying how to make a request to the *provider* as well as describing the format in which the request response will be provided.

The CURIEMap serves several purposes:

- 1. It provides a controlled namespace for CURIE *prefixes* used in the AIRR Schema. For now, custom additions to or replacements of these *prefixes* in the schema are prohibited. This does not affect the ability of repositories to use such custom prefixes internally.
- 2. It simplifies resolution of CURIEs. The iri_prefix lists for each *prefix* should not be considered to be exhaustive. However, when using a custom iri_prefix, it must be ensured that the expanded IRI still refers to the same concept/instance as when using the default iri_prefix.
- 3. It simplifies computation using CURIES. It is possible to use the **provider** for a *prefix* as a mechanism to look up a CURIE from a *provider* with a defined response (See below)

It should be explicitly noted that the CURIEMap should not be interpreted as any kind of recommendation for certain *providers*. It is left up to users to decide how to resolve the resulting IRIs, e.g., via DNS/HTTP (if possible) or by using a *provider* of their choice.

General Policies

Criteria

Ontologies used within AIRR standards

- 1. MUST [1]_ cover the majority of the required terms, but complete coverage is OPTIONAL
- 2. MUST have a structure that is scientifically correct and logically coherent
- 3. MUST NOT feature complexity that makes it hard to use for queries and data representation
- 4. SHOULD already be widely adopted
- 5. MUST be actively maintained
- 6. MUST be available under a free license
- 7. SHOULD comply to the OBO Foundry Principles. This does not imply a preference.

Comments on criteria:

- ad (1): For most fields it will be difficult to find complete and accurate ontologies. Therefore picking the best available ontology and working with its maintainers to include missing terms is expected to be the most sustainable approach.
- ad (5): This requirement follows from (1), as there needs to be a way for term requests.
- ad (6): A number of ontologies need to be licensed from their respective copyright holders. This results in potential barriers for implementation and distribution of such ontologies. Therefore only ontologies available under a free license are considered suitable for AIRR-compliant databases. The list of suitable licenses is not final, but includes: CC0 and CC BY.
- ad (7): This is an endorsement of the OBO Foundry *Principles*, not of the OBO Foundry *Ontologies* in general. Hence, also non-OBO have an equal standing if they comply to the Principles.

Approved Ontologies

- Cell ontology (CL)
 - used in:
 - * Cell subset (cell_subset, Tissue and Cell Processing)
 - CURIE summary
 - * CURIE Prefix: CL
 - * CURIE IRI Prefix: http://purl.obolibrary.org/obo/CL_
 - example AIRR use
 - * "cell_subset.id" : "CL:0000542"
 - * "cell_subset.label" : "lymphocyte"
 - default root node
 - * label: lymphocyte

- * local id: CL_0000542
- * path: ``
- license: CC BY
- latest release (as of 2020-05-20): 2020-03-02
- repo: https://github.com/obophenotype/cell-ontology
- maintainer: Alexander Diehl, Buffalo, NY, US (addiehl@buffalo.edu)
- Human disease ontology (DOID)
 - used in:
 - * Diagnosis (disease_diagnosis, Diagnosis)
 - CURIE summary
 - * CURIE Prefix: DOID
 - * CURIE IRI Prefix: http://purl.obolibrary.org/obo/DOID_
 - example AIRR use
 - * "disease_diagnosis.id" : "DOID:9538"
 - * "disease_diagnosis.label" : "multiple myeloma"
 - default root node
 - * label: disease
 - * local ID: DOID:4
 - * path: disease
 - license: CC0
 - latest release (as of 2020-05-20): 2020-04-20
 - repo: https://github.com/DiseaseOntology/HumanDiseaseOntology
 - maintainer: Lynn Schriml, U Maryland, MD, US (lynn.schriml@gmail.com)
 - notes: Features ICD cross-reference
- NCBI organismal taxonomy (NCBITAXON)
 - used in:
 - * Species (species, *Subject*)
 - * Cell species (cell_species, Tissue and Cell Processing)
 - CURIE summary
 - * CURIE Prefix: NCBITAXON
 - * CURIE IRI Prefixes: http://purl.obolibrary.org/obo/NCBITaxon_, http://purl. bioontology.org/ontology/NCBITAXON/
 - example AIRR use
 - * "species.id" : "NCBITAXON:9606"
 - * "species.label" : "Homo sapiens"
 - default root node

- * label: Gnathostomata
- * local ID: 7776
- * path: cellular organisms/Eukaryota/Opisthokonta/Metazoa/Eumetazoa/Bilateria/ Deuterostomia/Chordata/Craniata/Vertebrata/Gnathostomata
- license: UMLS
- latest release (as of 2020-05-20): 2020-04-18
- repo: https://github.com/obophenotype/ncbitaxon
- maintainer: NCBI (info@ncbi.nlm.nih.gov)
- NCI thesaurus (NCIT)
 - used in:
 - * Study type (study_type, Study)
 - CURIE summary
 - * CURIE Prefix: NCIT
 - * CURIE IRI Prefixes: http://purl.obolibrary.org/obo/NCIT_, http://ncicb.nci.nih. gov/xml/owl/EVS/Thesaurus.owl#
 - example AIRR use
 - * "study_type.id" : "NCIT:C15197"
 - * "study_type.label" : "Case-Control Study"
 - default root node
 - * label: Study
 - * local ID: C63536
 - * path: Activity/Clinical or Research Activity/ Research Activity/Study
 - license: Public domain, credit of NCI is requested
 - repo: https://github.com/NCI-Thesaurus/thesaurus-obo-edition
 - latest release (as of 2020-05-20): 2020-05-04
 - maintainer: NCI (ncicbiitappssupport@mail.nih.gov)
- Units of measurement ontology (UO)
 - used in:
 - * Age unit (age_unit, Subject)
 - CURIE summary
 - * CURIE Prefix: U0
 - * CURIE IRI Prefix: http://purl.obolibrary.org/obo/U0_
 - example AIRR use
 - * "age_unit.id" : "UO:0000036"
 - * "age_unit.label" : "year"
 - default root node
 - * label: time unit

- * local ID: U0_000003
- * path: unit/time unit
- license: CC BY (per Github repo)
- repo: https://github.com/bio-ontology-research-group/unit-ontology
- latest release (as of 2020-05-20): 2020-05-18
- maintainer: unknown
- Uber-anatomy ontology (Uberon)
 - used in:
 - * Tissue (tissue, *Sample*)
 - CURIE summary
 - * CURIE Prefix: UBERON
 - * CURIE IRI Prefix: http://purl.obolibrary.org/obo/UBERON_
 - example AIRR use
 - * "tissue.id" : "UBERON:0002371"
 - * "tissue.label" : "bone marrow"
 - default root node
 - \ast label: multicellular anatomical structure
 - * local ID: UBERON:0010000
 - * path: /BF0_0000002/BF0_0000004/anatomical entity/material anatomical entity/ anatomical structure/multicellular anatomical structure
 - license: CC BY
 - repo: https://github.com/obophenotype/uberon
 - latest release (as of 2020-05-20): 2019-11-22
 - maintainer: Chris Mungall, LBL, CA, US (cjmungall@lbl.gov)

Computing with Ontologies

One of the key goals of using ontologies is to enable analysis tools to perform computation using the information in those ontologies. The AIRR Schema's CURIEMap lists one or more *providers* for each CURIE *prefix* that can be used programmatically by analysis tools. Although the AIRR Schema lists multiple providers for each ontology, this section focuses on the use of the EBI OLS *provider's* OLS Web API interface for querying ontologies.

If we consider the DOID *prefix* from the CURIEMap, the section below defines the use of the Human Disease Ontology (DOID) within the AIRR Standard:

```
DOID:
type: ontology
default:
map: OBO
provider: OLS
map:
```

(continued from previous page)

OBO: iri_prefix: "http://purl.obolibrary.org/obo/DOID_"

We see that the default map for DOID is OBO map, and the OBO map's iri_prefix is http://purl.obolibrary. org/obo/DOID_. Thus the mapping of the CURIE DOID:9538 (the CURIE for disease "multiple myeloma") will yield the resolved string http://purl.obolibrary.org/obo/DOID_9538. By the strictest of definitions, this is a valid IRI and should only be considered an identifier, but in this case this IRI is also a URL and can be used to look up the CURIE.

If we consider the default DOID provider in the CURIEMap, we see that it is OLS. Then, in the InformationProvider object of the AIRR Schema, under provider we see:

```
InformationProvider:
    provider:
    OLS:
        request:
        url: "https://www.ebi.ac.uk/ols/api/ontologies/{ontology_id}/terms?iri={iri}"
        response: application/json
```

And later we see that the parameters for OLS are:

```
parameter:
CL:
Ontobee:
ontology_id: CL
OLS:
ontology_id: cl
DOID:
Ontobee:
ontology_id: DOID
OLS:
ontology_id: doid
```

The above tells us that we can use the OLS provider to look up ontology terms. The {iri} component of the url string tells us that we need to use the resolved IRI and the {ontology_id} component tells us that we need to replace the ontology_id parameter in the URL with the DOID OLS parameter in the specification, which is the string doid. Thus the fully resolved URL to query for the CURIE DOID:9538 would be:

```
https://www.ebi.ac.uk/ols/api/ontologies/doid/terms?iri=http://purl.obolibrary.org/obo/

→DOID_9538
```

Again, referring to the OLS provider we see that we can expect an application/json response to the above query, and indeed the response we receive from the above starts with a JSON object as follows.

```
{
   "_embedded" : {
    "terms" : [ {
        "iri" : "http://purl.obolibrary.org/obo/DOID_9538",
        "label" : "multiple myeloma",
        "description" : [ "A myeloid neoplasm that is located_in the plasma cells in bone_
        →marrow." ],
        "annotation" : {
            "comment" : [ "OMIM mapping confirmed by DO. [SN]." ],
        }
    }
}
```

(continues on next page)

```
(continued from previous page)
```

```
"database_cross_reference" : [ "ICD10CM:C90.0", "MESH:D009101", "ICD9CM:203.0",
→ "GARD:7108", "NCI:C3242", "OMIM:254500", "ORDO:29073", "EFO:0001378", "SNOMEDCT_US_
→2020_09_01:94705007", "UMLS_CUI:C0026764" ],
      "has_obo_namespace" : [ "disease_ontology" ],
      "id" : [ "DOID:9538" ]
    },
    "synonyms" : [ "plasma cell myeloma" ],
    "ontology_name" : "doid",
    "ontology_prefix" : "DOID",
    "ontology_iri" : "http://purl.obolibrary.org/obo/doid.owl",
    "is_obsolete" : false,
    "term_replaced_by" : null,
    "is_defining_ontology" : true,
    "has_children" : true,
    "is_root" : false,
    "short_form" : "DOID_9538",
    "obo_id" : "DOID:9538",
    [Content edited because of length]
```

In this repsonse, you can see that the Ontology object that we requested has a label field that contains the value multiple myeloma and that the id field has a value of DOID:9538.

It is beyond the scope of this document to describe in detail the JSON structure of each of the providers, but this information can be discovered through the provider web sites. It should be noted that all Ontology objects in the AIRR specification have the OLS as a provider and therefore the method above can be used for any of the ontologies in the AIRR specification. Please see the OLS Web API documentation for details of the JSON response for the OLS provider.

Sprint Reports

OntoVoc Report - Sprint 11/2018

Objectives

The objectives of this first sprint in November 2018 were to:

- 1. define criteria for suitable ontologies
- 2. identify ontologies for five fields/keywords of the MiAIRR data standard and
- 3. assess technical aspects of ontology integration into databases

General Considerations

The Team initially discussed an approach where only vocabularies (i.e. lists of terms) and not ontologies (i.e. many terms connected by predicates) would have been defined. These vocabularies would have been derived from ontologies, but this process would not necessarily have been reversible. The notion at this time point was, that such an approach would allow to solve a number of problems like combining multiple sources and removing duplicated leaves. However, after some discussions this approach was effectively abandoned for a number of reasons:

• It would discard the UID for an entity. As the UID (in contrast to the name string) is guaranteed to be stable and unique, it facilitates updates, linking and information representation, all of which would otherwise be lost.

- In general, it will be more sustainable to work with the maintainers of an existing ontology to include entities/terms, than just dumping their terms into a list and adding new ones.
- Well-designed ontologies will not contain duplicated entities, although they might appear to do so in a simple browsers (i.e. this is an artifact of representation). Ontologies that actually do contain duplicates are excluded by *criterium 2*.

Criteria for Ontologies

Criteria

Ontologies used within AIRR standards

- 1. MUST¹ cover the majority of the required terms, but complete coverage is OPTIONAL
- 2. MUST have a structure that is scientifically correct and logically coherent
- 3. MUST NOT feature complexity that makes it hard to use for queries and data representation
- 4. SHOULD already be widely adopted
- 5. MUST be actively maintained
- 6. MUST be available under a free license

Comments on criteria:

- ad (1): For most fields it will be difficult to find complete and accurate ontologies. Therefore picking the best available ontology and working with its maintainers to include missing terms is expected to be the most sustainable approach.
- ad (5): This requirement follows from (1), as there needs to be a way for term requests.
- ad (6): A number of ontologies need to be licensed from their respective copyright holders. This results in potential barriers for implementation and distribution of such ontologies. Therefore only ontologies available under a free license are considered suitable for AIRR-compliant databases. The list of suitable licenses is not final, but includes: CC0 and CC BY.

Selected Ontologies

(designations are MiAIRR field names and DataRep keywords)

Completed

- Species (organism)
 - NCBITAXON
 - license: UMLS²
 - latest release: 2018-07-06
 - maintainer: NCBI (info@ncbi.nlm.nih.gov)
- Diagnosis (disease_diagnosis)

¹ See the "Glossary" section on how to interpret term written in all-caps.

² Will require further review the UMLS Metathesaurus License is not a free license, however it needs to be clarified how much of it relates to the work (i.e. the taxonomy itself) and how much to the service.

- DOID
- root node
 - * name: disease
 - * ID: DOID:4
 - * path: /disease
- License: CC BY
- latest release: 2018-03-02
- maintainer: Lynn Schriml, U Maryland, MD, US (lynn.schriml@gmail.com)
- notes: Features ICD cross-reference
- Cell subset (cell_subset)
 - CellOntology
 - license: CC BY
 - latest release: 2018-07-11
 - maintainer: Alexander Diehl, Buffalo, NY, US (addiehl@buffalo.edu)
- Tissue (tissue)
 - Uberon
 - root node
 - * name: multicellular anatomical structure
 - * ID: UBERON:0010000
 - * path: /BF0_0000002/BF0_0000004/anatomical entity/material anatomical entity/ anatomical structure/multicellular anatomical structure
 - License: CC BY
 - latest release: 2018-10-15
 - Maintainer: Chris Mungall, LBL, CA, US (cjmungall@lbl.gov)

Under evaluation

- Strain name (strain_name)
 - Suggested ontologies:

* JAX

- * IEDB
- Issues:
 - * Nomenclature
 - * one ontology is not enough

Technical aspects

- Repositories:
 - UID assigned by ontologies are guaranteed to be unique and permanent³.
 - A repository MAY use internal identifiers that are distinct from UIDs. However, to be AIRR-compliant it MUST be able to map UIDs to its identifiers.
 - Points of "AIRR compliance" would typically be:
 - * When data is extracted from the repository through a Query API (CRWG)
 - * When data is extracted from the repository into a file format (DataRep)
- Integration of ontologies into repositories:
 - There are two main ontology providers offering a REST API and all the ontologies listed above:
 - * NCBO Bioportal
 - * OLS ontology
 - NCBO can apparently be slow and sometimes not that stable, while OLS seems to be more stable and potentially has a better long-term support.
 - Remote ontology services tend to be slow and create external dependencies. On the other hand, while local hosting of an ontology is possible (and partially supported by NCBO and OLS), it requires non-negligible resources. The Team's current assumption is that queries to remote ontology services can be substantially accelerated if only the relevant section of a respective ontology is queried. Therefore a local service would not be necessary.
 - Repositories should store both the IDs and the values in their database. This way, they do not have to query the ontology in a scenario where human-readable output is required. In the case of changes, most ontologies try to follow the practice of not changing a term value but instead create a new term with the new value and a new ID, and deprecating the old term. Therefore term deprecation needs to be handled by the repository.
 - Like for the databases, also the API should be able to handle both IDs and values as query input and return both during a query.
 - The user interface (UI) should offer an ontology-backed autocomplete. NCBO provides some JavaScript code to use. The UI must not offer deprecated terms. To allow entry of terms not present in the ontology, data can be prefixed with some text that will allow the data validation to proceed (e.g., if an entry starts with "other -" the UI will not autocomplete/validate). Later, i.e. when the term has been created, the data will be updated.
- Note that the complete IEDB can be downloaded as SQL dump, it is licensed under CC BY. At a first glance, the main overlap seems to be with organism, strain_name and to a smaller extent disease_diagnosis. However, sample information like cell_subset and tissue seems to be largely absent from IEDB, so it could currently not be the one-stop solution for AIRR.

 $^{^{3}}$ This has more recently (early 2020) been called in question and will be revisited during the next sprint. Note that the uncertainty revolves around the question what exactly constitues a UID, rather than the question whether a UID is permanent and unique.

Footnotes

Appendix

Glossary

- MUST / REQUIRED: Indicates that an element or action is necessary to conform to the standard.
- SHOULD / RECOMMENDED: Indicates that an element or action is considered to be best practice by AIRR, but not necessary to conform to the standard.
- MAY / OPTIONAL: Indicates that it is at the discretion of the user to use an element or perform an action.
- MUST NOT / FORBIDDEN: Indicates that an element or action will be in conflict with the standard.

OntoVoc Report - Sprint 04/2020

Objectives

The objectives of this second sprint in April 2020 were to:

- 1. revisit general policies around ontologies used in the AIRR schema
- 2. identify two new ontologies for several fields of the AIRR schema
- 3. solve technical questions regarding IDs and providers

General Policies

The OntoVoc team revisited the criteria for ontologies used in the AIRR schema that it *defined in the 11/2018 sprint*. While they are still considered to be valid, the team felt that a more detailed guidance could be useful in the process of selecting ontologies for new fields. It therefore evaluated the OBO Foundry Principles, which partially re-iterate some of the existing criteria (e.g., *Openness* and *Maintenance*), but also provide additional recommendations, e.g., the presence of textual definitions, clear scope and a common format, which were considered to be valuable additions to the existing guidelines. The team therefore decided to endorse the OBO Foundry Principles, as RECOMMENDED (but NOT REQUIRED) criteria. It should be noted, that this does not make any statement regarding the use of OBO vs. non-OBO ontologies.

Decisions on Pending Items of Sprint 11/2018

A number of decisions on draft and legacy ontologies as well as root nodes was not officially passed during the last sprint. The team thus revisited and confirmed the following decisions:

- Use of NCIT for study_type, top node Study (NCIT:C63536).
- Use of UO for age_unit, top node time unit (UO:0000003).
- Use of `Gnathostomata (NCBITAXON:7776) as top node for NCBITAXON when used for fields encoding a host species.
- Use of lymphocyte (CL:0000542) as top node for CL when used for cell_subset.

New Ontologies

Mouse strain

Background

Mouse strain names follow a very elaborate nomenclature that is capable of describing the genetic background, breeding history and introduced mutation in a detailed manner. However, this nomenclature is rarely used correctly (if at all), which creates uncertainty about the identity of strains used in experimental studies. Therefore an ontology or vocabulary compliant to this nomenclature would be of tremendous help for consistent annotation.

An ontology for the strain_name field was already on the list for the last sprint, however it was not possible to identify a single ontology that would contain comprehensive information about strains from multiple species. This situation created a problem that could not be resolved then. In the meantime, the concept of "extensions" has been introduced to the AIRR schema, which create an additional layer of fields (and associated ontologies) on top of a core schema. As these extensions can be made conditional on the value of fields within the core schema, it has now become possible to have multiple extensions defining the strain_name field, but for different species and therefore with distinct speciesspecific ontologies.

Having addressed this issue, the other key problem that remains is the absence of an actual ontology for mouse strains, while a rat strain ontology exists. Therefore in a first step it is necessary to identify resources that you at least serve as a provider for vocabularies. The two potential candidates that were identified are:

- MGI: The Mouse Genome Informatics database hosted at JAX aims to be comprehensive in regard to all mouse strains that have been published in the literature.
- IEDB: The Immune Epitope Database already ran into the problem of a missing mouse ontology and therefore decided to build up their own reference focused on immunologically relevant strains, as part of their Ontie database.

Once it is clear which of the resources could be used, it will be necessary to approach the current maintainers regarding their willingness to convert the data into an actual ontology (the RS could serve as a template for this). As this will take longer than just a couple of weeks, the second step is out-of-scope for this sprint.

Evaluation

- MGI: The database can be downloaded as a dump, however the licensing conditions are unclear. It contains a total of 60k entries of which 3.2k inbred and 13.8k are congenic strains. The majority of the remaining entries are coisogenic strains, most of them from large- scale gene KO projects.
- IEDB: Database dumps can also be downloaded and are freely available under CC-BY 4.0. It covers over a thousand mouse strains and contains additional information on the genetic background of a strain.

Next steps

• Get in touch with JAX (pending)

Geolocation

There are several (planned) extensions to the AIRR metadata standard that will provide geospatial metadata. Countrylevel information is typically assumed to be privacy-preserving and easy to operationalize. Therefore, while clearly only capturing some aspects of genetic ancestry, it might serve as a proxy for concepts of "race" and "ethnicity" that are rather ill-defined.

Potential candidate vocabularies/ontologies:

- ISO3166-1 alpha-2: Two-letter code, some ambiguity but well known from ccTLDs.
- ISO3166-1 alpha-3: Three-letter code, less ambiguity than alpha-2.
- UN Stats Division code (currently M49): Numerical code, not human-readable, maps to ISO3166-1 alpha-3.
- Gazetter (GAZ)
 - Contains 2nd (state) and 3rd (county) level information.
 - Not linked to any actual coordinates
 - ISO3166-1 annotation is incomplete and lacks e.g. for Germany and Switzerland.
 - Does not support German Umlauts. Äbsölütely inacceptable, as these are not just diacritical marks (i.e. "Münster" and "Munster" are two different cities).
- HANCESTRO:
 - Seems to be complete, but does not provide ISO3166 codes.
 - Ontology could also be used for other fields relating to genetic ancestry.
 - Links to DBpedia, currently unclear whether it is also populated from there
 - country node has pan-240 leaves (surplus seems due to oversea territories), cross-referencing to GAZ (s/a)
- Various pathogen-related repositories:
 - VectorBase (VBGEO): see link and choose "GADM/VBGEO PlaceNames"
 - Viral Pathogen Resource (ViPR):
 - * Uses v1.3 of the GSCID/BRC Project and Sample Application Standard.
 - * GSCID/BRC Core Sample defines four fields for "Collection Location":
 - · "Latitude" (CS11) and "Longitude" (CS12) in ISO 6709 format
 - · "Location" (CS13), using GAZ as controlled vocabulary
 - "Country" (CS14) as by ISO3166-1 (alpha-2).
 - Influenza Research Database (IRD): Flu-focused version of ViPR, also uses GSCID/BRC Project and Sample Application Standard v1.3.
 - Pathosystems Resource Integration Center (Patric): Focused on bacterial infectious diseases. Uses an "Isolation Country" field in their "Genome" table, format seems to be full text.

Rejected candidates:

- HL7: own ontology deprecated, now recommends ISO 3166-1 alpha-3 set.
- NCIT: Incomplete, only contains pan-90 entities
- SNOMED: Licensing issues
- GADM data: Good quality and resolution, but not an ontology in itself. Also not under a free license, does not allow redistribution or commercial use.

Evaluation

Given the number of options, there is no obvious candidate to pick. Therefore the team decided to define clear use cases and then evaluate each options against them. However, due to time limitation, we did not really get into this, will have to follow up in the next sprint. The use cases so far were:

- Annotate country of birth / of sampling [REQUIRED]
- Encode higher resolution than country level if legally permitted and scientifically meaningful [RECOM-MENDED].
- Linking to geo-spatial coordinates [OPTIONAL]

Technical Questions

Background and Problem

Some nomenclature first: The nodes in an ontology graph are typically either *concepts* (e.g., capital) or *instances* thereof (e.g., Paris). These nodes have *local IDs* (often numbers), which are unique within an ontology. They also typically have *labels*, which is the human- readable name of the node. Nodes can have additional *attributes* (e.g., "population count") and are connected to other nodes by *relations* (e.g., "is-a", "superset-of"), which create the edges of the graph.

The complete ontology is usually represented in an XML or OWL file. However, we are looking for a *provider*, i.e. a service that facilitates queries of an ontology via web and/or an API-based interface. Upon querying with a unique ID, is it expected that a *provider* will be able to return the record of a node, which should contain all attributes and relations. Furthermore a *provider* might allow set- and graph-based queries (e.g., is A a complete subset of B; what is the last common ancestor of A and B). Finally a *provider* can offer lookup services, i.e., identify the corresponding *concept* or *instance* in another ontology. Until now we have mainly looked at three providers: Ontobee, OLS and BioPortal. While they all provide similar basic services, it should be noted that some biomedical databases and repositories are, by convention, restricted to use certain *providers*.

As stated above, each node has a *local ID*. To avoid conflicts between the *local IDs* of multiple ontologies, *providers* and ontology collections (e.g., OBO Foundry) use a namespace, i.e., some abbreviation for the ontology that is prefixed to the *local ID*. However, as there no common standard how to create these prefixes, this system is only unambiguous and collision-safe within a single *provider*. To resolve this issue, ontologies often use International Resource Identifiers (IRI, [RFC3987]). While IRIs look like HTTP URLs, they should primarily be considered as permanent and globally unique identifiers, which might resolve to the node's record via DNS/HTTP, but this is optional. In addition, potential intermediate URLs generated in the DNS/HTTP resolving process must be considered case-sensitive, especially when used as identifiers (per [RFC3987], Section 5.3.2.1, which only excludes the schema and host (authority) component for case-sensitivity).

While many ontologies already define an entities IRI on the level of the ontology, there are some that do not. For such ontologies, IRIs are then assigned by the provider. The most notable example for this are the UMLS ontologies like the NCBI Taxonomy. This leads to the situation that a single node in an ontology, stored by two providers can have different IRIs. Therefore, a concept from NCBI Taxonomy, e.g., the duck-billed platypus (label: *Ornithorhynchus anatinus*, local ID: 9258) has the IRI http://purl.obolibrary.org/obo/NCBITaxon_9258 in Ontobee and the IRI http://purl.bioontology.org/ontology/NCBITAXON/9258 in BioPortal. In addition, other providers might choose to use one of these IRIs too, although it will never resolve to their system via DNS/HTTP (e.g., OLS uses the Ontobee IRIs).

For the AIRR Community, this creates the challenge that we want to be able to have unambiguous identifiers, without requiring any specific provider.

Proposed solution

Compact URIs (CURIEs) are a standardized way to abbreviate IRIs, which includes URIs as a subset. They were originally conceived to simplify the handling of attributes, e.g. in XML or SPARQL, by making them more compact and readable. CURIEs are e.g. used by IEDB databases to reduce redundancies (mainly in the leading part of IRIs).

A typical CURIE would, e.g., look like NCBITAXON:9258. In this case, NCBITAXON is the *prefix*, a custom string that will be replaced by a repository-defined IRI component (e.g., http://purl.obolibrary.org/obo/NCBITaxon_). Note that there is no connection between NCBITAXON in the CURIE and NCBITAxon in the IRI, the former one is just a placeholder.

This resolves the issue of different *providers* usings different IRIs with distinct formatting rules (as described above). As the choice of the *provider* is independent for each ontology, it allows greater flexibility for the repositories, as they do not need a single *provider* that needs be able to resolve all terms. Similarly, different repositories can use the same ontology, but use different *providers*. Note that this would not require changes to the data, as the data would only contains CURIEs, not the (provider-specific) IRIs.

The AIRR schema will provide a list of AIRR approved CURIE *prefixes* along with a list of at least one IRI *prefix* (i.e., replacement string) for each them. This list serves two purposes:

- 1. It provides a controlled namespace for CURIE *prefixes* used in the AIRR schema. For now, custom additions to or replacements of these *prefixes* in the schema are prohibited. This does not affect the ability of repositories to use such custom prefixes internally.
- 2. It simplifies resolution of CURIEs by non-repositories. The lists of IRI *prefixes* for each CURIE *prefix* should not be considered to be exhaustive. However, when using custom IRI *prefixes*, it must be ensured that they refer to the same ontology as the provider *prefixes*.

It should be explicitly noted that the IRI *prefix* list should not be interpreted as any kind of recommendation for certain *providers*. It is left up to users to decide how to resolve the resulting IRIs, e.g., via DNS/HTTP (if possible) or by using a *provider* of their choice.

Modifications to the AIRR schema

All changes to the AIRR schema that would be based on the sprint can currently be reviewed on Github in Pull Request #385. These changes are intended to be included into the next major release.

Clarifications

- Root nodes are specific to individual fields, not to an ontology. Therefore, NCBITAXON will use a root node of "Gnathostomata" for the annotations of the host species, but this would not be useful, e.g., if it would be used to annotate pathogenic organisms, which will require a top node at the apex of the hierarchy.
- The labels (previous: values) that are provided in the schema for ontology-based fields, should be considered an addition for convenience and not as being authoritative. Repositories or applications can choose to link synonyms to given concepts (e.g., "human" for "*Homo sapiens*") to simply search queries. Repositories further can provide such a synonym in the label field upon exporting data. However, repositories importing data should verify the correctness of labels that do not match the one provided by the ontology. Importing repositories must not be expected to allow for queries of labels other than those present in the ontology.

Annotation guidance

Note that this section is only a parking lot, the respective text will be moved into the AIRR Docs in the final version.

• Cells that come from Ficoll gradients should not be annotated as PBMCs as this is a sister node of lymphocyte. For the other sampling related fields, in nearly all cases venous blood (UBERON:0013756) will be the correct tissue and it should be used in the case of sample_type:peripheral venous puncture. However, if the mode of sampling is not specified, blood (UBERON:0000178) should be used instead. Also see https://github. com/airr-community/airr-standards/issues/242

OntoVoc Report - Sprint 04/2021

Objectives

The objectives of this third sprint in April 2021 were to:

- Revisit General Policies
- CURIE for PIDs
- Assess whether the use of multiple ontologies for single fields should be allowed
- Use of IDs and labels
- Provide guidance on cell_population annotation

General Policies

The OntoVoc team revisited the criteria for ontologies used in the AIRR schema that it *defined in the 11/2018 sprint* and that were expanded in the 04/2020 sprint to include the OBO Foundry Principles.

CURIEs for PIDs

This is not directly related to ontologies, but as it does touch upon the use of CURIEs in the AIRR Schema, it does fall into the scope of OntoVoc. Main question is whether and how we can use, e.g., ORCIDs in Repos (see #476). The top-level conclusion on this topic is that CURIE can be used by repositories for non-ontology PIDs, but that the exact specification should be addresses by ComRepo WG. However, it should be noted that there are two functions a CURIE can serve:

- A CURIE can be used to create a unique ID. In this case the prefix serves as/provides a namespace.
- An expanded CURIE (i.e. URI) can be used to retrieve data, i.e., using it as a PID in the strict sense.

As there is no standard what type of information is provided by an URI (in the second case) there should be hints in the schema, e.g., on human vs. machine-readable data.

Use of multiple ontologies for a single field

While it sometime would be preferable to have multiple ontologies available for a given field, the group came to the conclusing that this is would more likely than not reduce the interoperability of the data:

- Overlaps between two accepted ontologies would be problematic as this creates an ambiguity about which term to use. This ambiguity jeopardizes the linkage possibilities that ontologies should provide.
- Although OLS has a term-mapping service, this does not ensure that the same term in two different ontologies represents the same concept. Also the logical structure between ontologies might differ, complicating things even further.
- There might however be very special and restricted use cases in which ontologies are orthogonal to each other and therefore the union of both could be used. This would in addition require a common structure that should exists for OBO ontologies. However, until there is a clear use case for this that cannot be solved in any other way, we will not allow multiple ontologies per term.

Use of IDs and labels

It should be reiterated that:

- The id is the authorative and required part of the information, the label is at the discretion of the repository and is provided to the user as complementrary information (so that the user does not need to resolve the id).
- Repositories MUST support searches for the official label term, they SHOULD support ontology synonyms and they MAY support their own synonyms (termed "alias").
- Data returned by a repository MUST provide the official term as label and MAY provide or not provide a set of synonyms/aliases in the novel synonyms array.
- The behavior of a synonyms field can be altered by the user query.
- Some PID types might not have a meaningful label. Therefore label MAY be NULL.

Provide guidance on cell_population annotation

Added to documentation

2.3.6 Schema Release Notes

Version 1.4.1: August 27, 2022

Version 1.4 schema release.

New General Purpose Schema:

- 1. Introduced the experimental DataFile object, which defines a JSON file holding Repertoire metadata, data processing analysis objects, or any object in the AIRR Data Model.
- 2. Introduced the experimental RepertoireGroup Schema for describing collections of repertoires to be analyzed together.
- 3. Introduced the experimental InfoObject Schema, which provides information about data and ADC API responses.
- 4. Introduced the experimental TimePoint Schema for defining the time point at which an observation or other action was performed.

New Germline and Genotype Schema:

The following experimental schema were introduced to support storage of VDJ germline reference sequences, VDJ genotypes, and MHC genotypes:

- 1. GermlineSet: Defines a collection of AlleleDescriptions from the same strain or species.
- 2. AlleleDescription: Details of a putative or confirmed Ig receptor gene/allele inferred from one or more observations.
- 3. RearrangedSequence: Details of a directly observed rearranged sequence or an inference from rearranged sequences contributing support for a gene or allele.
- 4. UnrearrangedSequence: Details of an unrearranged sequence contributing support for a gene or allele.
- 5. SequenceDelineationV: Delineation of a V-gene in a particular system.
- 6. GenotypeSet: Defines a collection a VDJ genotypes for a given subject.
- 7. Genotype: Enumerates the alleles and gene deletions inferred in a single subject for a single locus.
- 8. MHCGenotypeSet: Defines a collection of MHC genotypes for a given subject.
- 9. MHCGenotype: Details the genotype of major histocompatibility complex (MHC) class I, class II and nonclassical loci.
- 10. Acknowledgement: Defines contributors to the germline or genotype description.

New Single-cell Schema:

The following experimental schema were introduced to improve support for single-cell data and extend the Cell schema.

- 1. CellExpression: Defines a container to store single-cell expression level measurements.
- 2. Receptor: Describes a complete receptor protein sequence and its reactivity.

Rearrangement Schema:

- 1. Added the optional fields v_frameshift, j_frameshift, d_frame and d2_frame defining annotations related to alignment reading frames.
- 2. Added the optional field umi_count to represent the count of distinct UMIs for a sequence.
- 3. Modified the definition of duplicate_count to remove ambiguity with the new umi_count field in a singlecell context. There is now a distinction between duplicate observed sequences (duplicate_count) and UMIs (umi_count).
- 4. The optional quality and quality_alignment alignment fields were added to store Phred quality scores for base calls in the sequence and sequence_alignment fields, respectively.
- 5. The following optional fields were added to denote constant region (c_call) alignment positions: c_sequence_start, c_sequence_end, c_germline_start, c_germline_end, c_alignment_start, c_alignment_end.

Study Schema:

- 1. Added the optional fields study_contact to store contact information for the primary study contact.
- 2. Modified the enumerated values supported by keywords_study to the following set: contains_ig, contains_tr, contains_paired_chain, contains_schema_rearrangement, contains_schema_clone, contains_schema_cell, contains_schema_receptor
- 3. Added the optional fields adc_publish_date and adc_update_data that timestamp AIRR Data Commons initial publication and last update, respectively.

Subject Schema:

1. Added the optional genotype field linking to the new GenotypeSet and MHCGenotypeSet objects.

Sample Schema:

- 1. Added the required field collection_time_point_relative_unit defining the units for the sample collection timestamp.
- 2. Modified the type of the field collection_time_point_relative from a string to a number defined in combination with the new unit ontology field collection_time_point_relative_unit.

NucleicAcidProcessing Schema:

- 1. Added the required field template_amount_unit defining the units for the input template quantification.
- 2. Modified the type of the template_amount field from a string to a number defined in the combination with the new unit ontology field ``template_amount_unit`.

Clone Schema:

- 1. Added the optional clone_count field to specify absolute count of clonal members.
- 2. Added the optional umi_count field to specify the total UMI count of all clonal members.

Cell Schema:

1. Removed the field expression_tabular whose functionality has been replaced by the new CellExpression schema.

Version 1.3.1: October 13, 2020

Version 1.3 documentation patch release.

Alignment Schema:

1. Added the deprecation tags for rearrangement_id, which were accidentally left out of the v1.3.0 release.

Version 1.3.0: May 28, 2020

Version 1.3 schema release.

New Schema:

- 1. Introduced the Repertoire Schema for describing study meta data.
- 2. Introduced the PCRTarget Schema for describing primer target locations.
- 3. Introduced the SampleProcessing Schema for describing experimental processing steps for a sample.
- 4. Replaced the SoftwareProcessing schema with the DataProcessing schema.
- 5. Introduced experimental schema for clonal clusters, lineage trees, tree nodes, and cells as Clone, Tree, Node, and Cell objects, respectively.

General Updates:

- 1. Added multiple additional attributes to a large number of schema propertes as AIRR extension attributes in the x-airr field. The new Attributes object contains definitions for these x-airr field attributes.
- 2. Added the top level required property to all relevant schema objects.
- 3. Added the title attribute containing the short, descriptive name to all relevant schema object fields.
- 4. Added an example attribute containing an example data value to multiple schema object fields.

AIRR Data Commons API:

1. Added OpenAPI V2 specification (specs/adc-api.yaml) for AIRR Data Commons API major version 1.

Ontology Support:

- 1. Added Ontology and CURIEResolution objects to support ontologies.
- 2. Added vocabularies/ontologies as JSON string for: Cell subset, Target substrate, Library generation method, Complete sequences, Physical linkage of different loci.

Rearrangement Schema:

- 1. Added the complete_vdj field to annotate whether a V(D)J alignment was full length.
- 2. Added the junction_length_aa field defining the length of the junction amino acid sequence.
- 3. Added the repertoire_id, sample_processing_id, and data_processing_id fields to serve as linkers to the appropriate metadata objects.
- 4. Added a controlled vocabulary to the locus field: IGH, IGI, IGK, IGL, TRA, TRB, TRD, TRG.
- 5. Deprecated the rearrangement_set_id and germline_database fields.
- Deprecated rearrangement_id field and made the sequence_id field be the primary unique identifer for a rearrangement record, both in files and data repositories.
- 7. Added support secondary D gene rearrangement through the additional fields: d2_call, d2_score, d2_identity, d2_support, d2_cigar np3, np3_aa, np3_length, n3_length, p5d2_length, p3d2_length, d2_sequence_start, d2_sequence_end, d2_germline_start, d2_germline_start, d2_alignment_start, d2_alignment_end, d2_sequence_alignment, d2_sequence_alignment_aa, d2_germline_alignment, d2_germline_alignment_aa.
- 8. Updated field definitions with more concise V(D)J call descriptions.

Alignment Schema:

- 1. Deprecated the rearrangement_set_id and germline_database fields.
- 2. Added the data_processing_id field.

Study Schema:

1. Added the study_type field containing an ontology defined term for the study design.

Subject Schema:

- 1. Deprecated the organism field in favor of the new species field.
- 2. Deprecated the age field.
- 3. Introduced age ranges: age_min, age_max, and age_unit.

Diagnosis Schema:

1. Changed the type of the disease_diagnosis field from string to Ontology.

Sample Schema:

1. Changed the type of the tissue field from string to Ontology.

CellProcessing Schema:

- 1. Changed the type of the cell_subset field from string to Ontology.
- 2. Introduced the cell_species field which denotes the species from which the analyzed cells originate.

NucleicAcidProcessing Schema:

1. Defined the template_class field as type string.

- 2. Added a controlled vocabulary the library_generation_method field.
- 3. Changed the controlled vocabulary terms of complete_sequences. Replacing complete & untemplated with complete+untemplated and adding mixed.
- 4. Added the pcr_target field referencing the new PCRTarget schema object.

SequencingRun Schema:

- 1. Added the sequencing_run_id field which serves as the object identifer field.
- 2. Added the sequencing_files field which links to the RawSequenceData schema objects defining the raw read data.

RawSequenceData Schema:

- 1. Added the file_type field defining the sequence file type. This field is a controlled vocabulary restricted to: fasta, fastq.
- 2. Added the paired_read_length field defining mate-pair read lengths.
- 3. Defined the read_direction and paired_read_direction fields as type string.

DataProcessing Schema:

- 1. Replaces the SoftwareProcessing object.
- 2. Added data_processing_id, primary_annotation, data_processing_files, germline_database and analysis_provenance_id fields.

Version 1.2.1: Oct 5, 2018

Minor patch release.

- 1. Schema gene vs segment terminology corrections
- 2. Added Info object
- 3. Updated cell_subset URL in AIRR schema

Version 1.2.0: Aug 18, 2018

Peer reviewed released of the Rearrangement schema.

- 1. Definition change for the coordinate fields of the Rearrangement and Alignment schema. Coordinates are now defined as 1-based closed intervals, instead of 0-based half-open intervals (as previously defined in v1.1 of the schema).
- 2. Removed foreign study_id fields
- 3. Introduced keywords_study field

Version 1.1.0: May 3, 2018

Initial public released of the Rearrangement and Alignment schemas.

- 1. Added required and nullable constrains to AIRR schema.
- 2. Schema definitions for MiAIRR attributes and ontology.
- 3. Introduction of an x-airr object indicating if field is required by MiAIRR.
- 4. Rename rearrangement_set_id to data_processing_id.
- 5. Rename study_description to study_type.
- 6. Added physical_quantity format.
- 7. Raw sequencing files into separate schema object.
- 8. Rename Attributes object.
- 9. Added primary_annotation and repertoire_id.
- 10. Added diagnosis to repertoire object.
- 11. Added ontology for organism.
- 12. Added more detailed specification of sequencing_run, repertoire and rearrangement.
- 13. Added repertoire schema.
- 14. Rename definitions.yaml to airr-schema.yaml.
- 15. Removed c_call, c_score and c_cigar from required as this is not typical reference aligner output.
- 16. Renamed vdj_score, vdj_identity, vdj_evalue, and vdj_cigar to score, identity, evalue, and cigar.
- 17. Added missing c_identity and c_evalue fields to Rearrangement spec.
- 18. Swapped order of N and S operators in CIGAR string.
- 19. Some description clean up for consistency in Rearrangement spec.
- 20. Remove repeated objects in definitions.yaml.
- 21. Added Alignment object to definitions.yaml.
- 22. Updated MiARR format consistency check TSV with junction change.
- 23. Changed definition from functional to productive.

Version 1.0.1: Jan 9, 2018

MiAIRR v1 official release and initial draft of Rearrangement and Alignment schemas.

2.4 Data Submission and Query

2.4.1 Data Submission Guides for AIRR-seq studies

There are multiple data repositories that accept submission of AIRR-seq datasets. Each provides different capabilities but all comply with the MiAIRR standard.

CAIRR Pipeline

Introduction: The CAIRR pipeline for submitting standards-compliant B and T cell receptor repertoire sequencing studies to the NCBI

AIRR sequencing (AIRR-seq) has tremendous potential to understand the dynamics of the immune repertoire in vaccinology, infectious disease, autoimmunity, and cancer biology. The adaptation of high-throughput sequencing (HTS) for AIRR (Adaptive Immune Receptor Repertoire) studies has made possible to characterize the AIRR at unprecedented depth and the outcome of such sequencing produces big data. Effective sharing of AIRR-seq big data could potentially reveal amazing scientific insights. The AIRR Community has proposed MiAIRR (Minimum information about an Adaptive Immune Receptor Repertoire Sequencing Experiment), a standard for reporting AIRR-seq studies. The MiAIRR standard has been implemented using the National Center for Biotechnology Information (NCBI) repositories. Submissions of AIRR-seq data to the NCBI repositories typically use a combination of web-based and flat-file templates and include only a minimal amount of terminology validation. As a result, AIRR-seq studies at the NCBI are often described using inconsistent terminologies, limiting scientists' ability to access, find, interoperate, and reuse the data sets and to understand how the experiments were performed. CEDAR (Center for Expanded Data Annotation and Retrieval) develops technologies involving the use of data standards and ontologies to improve metadata quality. In order to improve metadata quality and ease AIRR-seq study submission process, we have developed an AIRR-seq data submission pipeline named CEDAR-AIRR (CAIRR). CAIRR leverages CEDAR's technologies to: i) create webbased templates whose entries are controlled by ontology terms, ii) generate and validate metadata and iii) submit the ontology-linked metadata and sequence files (FASTQ) to the NCBI BioProject, BioSample, and Sequence Read Archive (SRA) databases. Thus, CAIRR provides a web-based metadata submission interface that supports compliance with MiAIRR standards. The interface enables ontology-based validation for several data elements, including: organism, disease, cell type and subtype, and tissue. This pipeline will facilitate the NCBI submission process and improve the metadata quality of AIRR-seq studies.

Submission Steps

The submission steps are described in the MiAIRR-to-NCBI Submission Manual: *Option 1. Submission via the CEDAR system (CAIRR submission pipeline).* You will need a CEDAR system account; you can self-register at https://cedar. metadatacenter.org. You will also need the identifier of a BioProject already entered in the NCBI BioProject database.

Tell Us About It

Please let us know how it went! If you are willing, we would love to have your comments in a short survey, it should just take 5 minutes or so.

We also welcome entry of issues and requests in our github repository issues, and emails can be sent to cedarusers@lists.stanford.edu. Both of these resources are publicly visible.

Support or Contact

Having trouble with NCBI submission process through our pipeline? Please email to Syed Ahmad Chan Bukhari or to Marcos Martínez-Romero and we will help you sort it out.

Introduction to VDJServer

VDJServer is a cloud-based analysis portal for immune repertoire sequence data that provides access to a suite of tools for a complete analysis workflow, including modules for preprocessing and quality control of sequence reads, V(D)J gene assignment, repertoire characterization, and repertoire comparison. VDJServer also provides sophisticated visualizations for exploratory analysis. It is accessible through a standard web browser via a graphical user interface designed for use by immunologists, clinicians, and bioinformatics researchers. VDJServer provides a data commons for public sharing of repertoire sequencing data, as well as private sharing of data between users.

- VDJServer website
- VDJServer Community Data Portal
- Email VDJServer for information about submission of your study data.

2.4.2 Data Submission for Inferred Genes and Alleles

In 2017, The AIRR Community established the Inferred Allele Review Committee (IARC) to evaluate inferred alleles for inclusion in relevant germline databases. IARC has worked, together with colleagues at IMGT and the US National Institutes of Health, to establish a systematic submission and review process. OGRDB was created and designed to support that process, and provide a real-time record of affirmed sequences.

OGRDB - reference database of inferred immune receptor genes

In recent years it has become possible to sequence immune receptor repertoires (immunoglobulins and T cell receptors) at great depth. The accurate analysis of these repertoires requires a comprehensive understanding of the germline genes that give rise to the repertoire through V(D)J gene recombination.

Even for well-studied species such as humans and mice, our knowledge of allelic variation is incomplete. Identifying new immunoglobulin and T cell receptor polymorphisms from the genome using traditional methods is technically challenging, because of the complex sequence architecture and repetitive nature of these loci. More recently, methods have been developed to infer novel sequences and alleles from sequenced repertoires.

The Adaptive Immune Receptor Repertoire (AIRR) Community was formed to promote and share good practice in adaptive immune repertoire sequencing. In 2017, it established the Inferred Allele Review Committee (IARC) to evaluate inferred alleles for inclusion in relevant germline databases. IARC's work is outlined in more detail in a poster, which was presented at a Systems Immunology Workshop at the University of Surrey, England, in March 2018, and in a recent paper. IARC has worked, together with colleagues at IMGT and the US National Institute of Health, to establish a systematic submission and review process. OGRDB was created and designed to support that process, and provide a real-time record of affirmed sequences. Affirmed sequences will be listed under the Sequences tab above, and the submissions that underpin them will be found under the Submissions tab. You can make your own submissions by following the steps below.

How to submit your sequences

As a first step, IARC is now ready to review submissions of inferred human IGHV genes and alleles. These sequences may be novel, or may extend incomplete sequences currently in the IMGT reference directories. Researchers interested in submitting sequences should:

Submission of IARC gene inference data to NCBI

General outline

IARC submission currently follows a "INSDC first" approach, means that all sequence data related to the reported inference is REQUIRED to be properly deposited in a general purpose sequence repository before it is reviewed by IARC. The submitter needs to complete the initial steps of submission to one of the INSDC repositories. Upon submission to IARC, some of this data will be pulled in from NCBI (TODO: What kind of data can we actually pull down from INSDC?)

The aim of this procedure is to ensure that inferences reviewed by IARC are public and will remain available in the long run. It is however explicitly *not* the aim to provide data that deterministically will yield the same inference results.

Deposition of inferred gene data at NCBI

At the end of the deposition process there should be three types of records present at NCBI:

- 1. A single record containing the final and full-length inferred sequence. The record is deposited in one of the following:
 - Genbank: All inferences that have been performed on the submitters own data CAN be submitted as [???] to Genbank. Note that Genbank typically only holds data that has a physical correlate which is not necessarily true for inferred sequences. Nevertheless NCBI currently accepts this as a kind of consensus building if it is performed on your own data. The Genbank record MUST link to the select set record (see 3.) via the DBLINK/DR field. Genbank records will be publicly available independent of other publications. Note that the for Genbank, the DBLINK field does not appear to be available through the BankIt submission interface.

You can use Tbl2asn and Sequin, and edit the DBLINK field manually (as "Sequence Read Archive" is not one of the options on the template creation page. A sample Genbank deposit can be found under accession MK321694.

• TPA (Third-party annotation): A segment of Genbank dedicated inferences. Also the TPA record MUST link to the select set record (see 3.) via the DBLINK/DR field. Note that in contrast to Genbank, TPA does REQUIRE a peer-reviewed publication describing the details of the inference process before the record will be made publicly available. A sample TPA deposit can be found under accession BK01573.

The format for both record types the Genbank format (link) with a standardized feature table (FT). Note that your initial submission MUST NOT contain any potential name for the gene as this will be assigned by IARC later on.

TODO: Is there any metadata that should be provided into the GB record?

- 2. One or multiple SRA records containing all raw reads of the the respective sequencing run. Note that if you are performing inference using third-party data, these records MUST be submitted by the original owner of the data. These record type will typically be present before the other. The metadata annotation of the records SHOULD be MiAIRR compliant [Rubelt et al.].
- 3. One or multiple SRA records containing the select set of reads from (2). The aim of these records is to document the number, quality, coverage and diversity of the reads in a dataset that _potentially_ support the inference. This means that the select set SHOULD be a superset of the reads that support the inference. It is NOT REQUIRED that inference tools deterministically return the inferred allele upon being fed with the select set. Generation of the select set from the complete set is described below. When submitting the select set to SRA the metadata context, i.e. the original links to project, sample and (if possible) experiment) SHOULD be maintained. Reads originating from multiple subjects or samples MUST NOT be pooled into a single new entry. The new record SHOULD be titled "Reads from <original_run_accession> supporting inference of Homo sapiens immunoglobulin heavy chain variable gene" and contain a design description, e.g., "Experimental workflow as described in original SRA/ENA record [<run_accession>]. Gene inference was performed using <software+version+parameters>. The reported reads were selected based on <selection_criteria>."

NOTE: It is reasonably likely, in the short term, that you will encounter questions from the SRA/ENA/Genbank staff about the nature of these deposits. If so, you can respond that they are made as part of a community effort to document novel alleles with an emphasis on transparency in data provenance. You can link to the IARC page and note that we worked together with IMGT and Genbank/TPA staff in designing this procedure.

Generating the select set

Below is the current procedure describing how to generate a select set using general purpose tools. This procedure was designed in a rather generic fashion so that it is easy to implement and does NOT REQUIRE inference tools to provide their own mechanisms. Note that it is currently assumed that the procedure is not fully deterministic, i.e. the select set cannot simply be generated using the complete read data and the inferred sequence, as there are additional filter criteria that apply. In addition the select set SHOULD not be subject to any modifications that are not listed below. This includes UMI-based consensus building or other aggregation steps that are not fully transparent to a third-party.

- 1. Assemble paired-end reads. The two reads MUST overlap. Recommended tool: PandaSeq
- 2. Perform PHRED filtering that is equivalent to the one performed by inference pipeline. Recommended tool: Immcantation suite
- 3. Perform a *blastn* search using the data from (2.) as query and bp 1-312 of the inferred gene as reference library. Require matches to be full-length and >99.6% ID. Record all matching read ID. Recommended tool: NCBI BLAST
- 4. Select the reads with the read ID found in (3.) from the original unmerged FASTQs. Note that each select set MUST be derived from a single donor and sample. Recommended tool: Christian's cryptic extractor script

5. Submit the select set to SRA

Submit the inferred sequences to IARC via OGRDB, following the

• OGRDB Submission Guide

Additional information is available at the

• OGRDB Website

References

2.4.3 Data Query and Download from the AIRR Data Commons

Submission of AIRR-seq datasets to public data repositories means that other researchers can query, download and reuse that data for novel analyses.

AIRR Data Commons

The AIRR Data Commons is a network of distributed repositories that store AIRR-seq data and adhere to the AIRR Community standards. We define the AIRR Data Commons as consisting of the set of repositories that both:

- Adhere to the AIRR Common Repositories Working Group recommendations for promoting, sharing, and use of AIRR-seq data.
- Implement the ADC API as a programmatic mechanism to access that data.

More information on repositories in the AIRR Data Commons and how to query these repositories can be found on the AIRR Data Commons page:

AIRR Data Commons

The use of high-throughput sequencing for profiling B-cell and T-cell receptors has resulted in a rapid increase in data generation. It is timely, therefore, for the Adaptive Immune Receptor Repertoire (AIRR) community to establish a clear set of community-accepted data and metadata standards; analytical tools; and policies and practices for infrastructure to support data deposit, curation, storage, and use. Such actions are in accordance with international funder and journal policies that promote data deposition and data sharing – at a minimum, data on which scientific publications are based should be made available immediately on publication. Data deposit in publicly accessible databases ensures that published results may be validated. Such deposition also facilitates reuse of data for the generation of new hypotheses and new knowledge.

The AIRR Common Repository Working Group (CRWG) has developed a set of recommendations that promote the deposit, sharing, and use of AIRR sequence data. These recommendations were refined following community discussions at the AIRR 2016 and 2017 Community Meetings and were approved through a vote by the AIRR Community at the AIRR Community Meeting in December 2017. Updates to these recommendations have continued, with the latest set of Recommendations ratified at the AIRR Community meeting in May 2019.

In May 2020, the AIRR Community released the first verion of the AIRR Data Commons Application Programming Interface (ADC API), a specification for programmatic access to query and download AIRR-seq data from repositories that adhere to the AIRR Standards. We define the AIRR Data Commons as consisting of the set of repositories that:

- · adhere to the CRWG recommendations for promoting, sharing, and use of AIRR-seq data, and
- that implement the ADC API as a programmatic mechanism to access that data.

This page provides a central location for the community to discover resources that belong to the AIRR Data Commons.

AIRR Data Commons Repositories

These data repositories all implement the AIRR Data Commons (ADC) API programmatic access to query and down-load AIRR-seq data.

- *iReceptor Public Archive* (Canada)
- *iReceptor COVID-19 Repository* (Canada)
- VDJServer Community Data Portal (US)
- sciReptor (Germany)
- VDJBase (Canada)
- NICD (Africa)
- University of Muenster (Germany)

Querying the AIRR Data Commons

Each of the repositories above can be queried directly using the *ADC API*. In addition, the following tools and platforms implement web based user interfaces that use the ADC API to query repositories in the AIRR Data Commons:

• *iReceptor Gateway*

There are *query and analysis use cases* and *a set of example queries* available for the AIRR Data Commons and the ADC API.

Other Public AIRR-Seq Repositories

There are additional data repositories that provide access to AIRR-seq data but which did not implement the ADC API for programmatic access. Information about some of these repositories are provided in a B-T.CR forum post.

Germline Gene Inference and Usage

- *OGRDB* provides a list of alleles affirmed by the AIRR Community's Inferred Allele Review Committee, together with supporting information.
- VDJbase provides gene usage information derived from a growing base of AIRR-seq repertoires, including inferred genotypes and haplotypes.

2.5 Software

2.5.1 AIRR Standards Reference Implementations

AIRR Python Reference Library

The airr reference library provides basic functions and classes for interacting with AIRR Community Data Representation Standards, including tools for read, write and validation.

API Reference

Rearrangement Interface

airr.read_rearrangement(filename, validate=False, debug=False)

Open an iterator to read an AIRR rearrangements file

Parameters

- **file** (*str*) path to the input file.
- **validate** (*bool*) whether to validate data as it is read, raising a ValidationError exception in the event of an error.
- **debug** (*boo1*) debug flag. If True print debugging information to standard error.

Returns iterable reader class.

Return type airr.io.RearrangementReader

airr.create_rearrangement(filename, fields=None, debug=False)

Create an empty AIRR rearrangements file writer

Parameters

- **filename** (*str*) output file path.
- **fields** (*list*) additional non-required fields to add to the output.
- **debug** (*boo1*) debug flag. If True print debugging information to standard error.

Returns open writer class.

Return type airr.io.RearrangementWriter

airr.derive_rearrangement(out_filename, in_filename, fields=None, debug=False)

Create an empty AIRR rearrangements file with fields derived from an existing file

Parameters

- **out_filename** (*str*) output file path.
- **in_filename** (*str*) existing file to derive fields from.
- **fields** (*list*) additional non-required fields to add to the output.
- debug (bool) debug flag. If True print debugging information to standard error.

Returns open writer class.

Return type *airr.io.RearrangementWriter*

airr.load_rearrangement(filename, validate=False, debug=False)

Load the contents of an AIRR rearrangements file into a data frame

Parameters

- **filename** (*str*) input file path.
- **validate** (*bool*) whether to validate data as it is read, raising a ValidationError exception in the event of an error.
- **debug** (*bool*) debug flag. If True print debugging information to standard error.

Returns Rearrangement records as rows of a data frame.

Return type pandas.DataFrame

airr.dump_rearrangement(dataframe, filename, debug=False)

Write the contents of a data frame to an AIRR rearrangements file

Parameters

- dataframe (pandas.DataFrame) data frame of rearrangement data.
- **filename** (*str*) output file path.
- **debug** (*bool*) debug flag. If True print debugging information to standard error.

Returns True if the file is written without error.

Return type bool

airr.merge_rearrangement(out_filename, in_filenames, drop=False, debug=False)

Merge one or more AIRR rearrangements files

Parameters

- **out_filename** (*str*) output file path.
- in_filenames (list) list of input files to merge.
- **drop** (*boo1*) drop flag. If True then drop fields that do not exist in all input files, otherwise combine fields from all input files.
- debug (bool) debug flag. If True print debugging information to standard error.

Returns True if files were successfully merged, otherwise False.

Return type bool

airr.validate_rearrangement(filename, debug=False)

Validates an AIRR rearrangements file

Parameters

- **filename** (*str*) path of the file to validate.
- debug (boo1) debug flag. If True print debugging information to standard error.

Returns True if files passed validation, otherwise False.

Return type bool

AIRR Data Model Interface

airr.read_airr(filename, format=None, validate=False, model=True, debug=False)

Load an AIRR Data file

Parameters

- **filename** (*str*) path to the input file.
- **format** (*str*) input file format valid strings are "yaml" or "json". If set to None, the file format will be automatically detected from the file extension.
- **validate** (*bool*) whether to validate data as it is read, raising a ValidationError exception in the event of a validation failure.
- **model** (*bool*) If True only validate objects defined in the AIRR DataFile schema. If False, attempt validation of all top-level objects. Ignored if validate=False.

• debug (bool) – debug flag. If True print debugging information to standard error.

Returns dictionary of AIRR Data objects.

Return type dict

airr.write_airr(filename, data, format=None, info=None, validate=False, model=True, debug=False) Write an AIRR Data file

Parameters

- **filename** (*str*) path to the output file.
- data (dict) dictionary of AIRR Data Model objects.
- **format** (*str*) output file format valid strings are "yaml" or "json". If set to None, the file format will be automatically detected from the file extension.
- info (object) info object to write. Will write current AIRR Schema info if not specified.
- **validate** (*bool*) whether to validate data before it is written, raising a ValidationError exception in the event of a validation failure.
- **model** (*boo1*) If True only validate and write objects defined in the AIRR DataFile schema. If False, attempt validation and write of all top-level objects
- debug (bool) debug flag. If True print debugging information to standard error.

Returns True if the file is written without error.

Return type bool

airr.validate_airr(data, model=True, debug=False)

Validates an AIRR Data file

Parameters

- data (dict) dictionary containing AIRR Data Model objects
- model (*boo1*) If True only validate objects defined in the AIRR DataFile schema. If False, attempt validation of all top-level objects
- debug (bool) debug flag. If True print debugging information to standard error.

Returns True if files passed validation, otherwise False.

Return type bool

Classes

```
class airr.io.RearrangementReader(handle, base=1, validate=False, debug=False)
```

Iterator for reading Rearrangement objects in TSV format

fields

field names in the input Rearrangement file.

Type list

external_fields

list of fields in the input file that are not part of the Rearrangement definition.

Type list

__init__(handle, base=1, validate=False, debug=False)

Initialization

Parameters

- handle (file) file handle of the open Rearrangement file.
- **base** (*int*) one of 0 or 1 specifying the coordinate schema in the input file. If 1, then the file is assumed to contain 1-based closed intervals that will be converted to python style 0-based half-open intervals for known fields. If 0, then values will be unchanged.
- **validate** (*bool*) perform validation. If True then basic validation will be performed will reading the data. A ValidationError exception will be raised if an error is found.
- debug (bool) debug state. If True prints debug information.

Returns reader object.

Return type airr.io.RearrangementReader

__iter__()

Iterator initializer

Returns airr.io.RearrangementReader

__next__()

Next method

Returns parsed Rearrangement data.

Return type dict

close()

Closes the Rearrangement file

next()

Next method

class airr.io.RearrangementWriter(handle, fields=None, base=1, debug=False)

Writer class for Rearrangement objects in TSV format

fields

field names in the output Rearrangement file.

Type list

external_fields

list of fields in the output file that are not part of the Rearrangement definition.

Type list

__init__(handle, fields=None, base=1, debug=False)

Initialization

Parameters

- handle (file) file handle of the open Rearrangements file.
- **fields** (*list*) list of non-required fields to add. May include fields undefined by the schema.

- **base** (*int*) one of 0 or 1 specifying the coordinate schema in the output file. Data provided to the write is assumed to be in python style 0-based half-open intervals. If 1, then data will be converted to 1-based closed intervals for known fields before writing. If 0, then values will be unchanged.
- **debug** (*bool*) debug state. If True prints debug information.

Returns writer object.

Return type *airr.io.RearrangementWriter*

close()

Closes the Rearrangement file

write(row)

Write a row to the Rearrangement file

Parameters row (dict) - row to write.

class airr.schema.Schema(definition)

AIRR schema definitions

definition

name of the schema definition.

info

schema info.

Type collections.OrderedDict

properties

field definitions.

Type collections.OrderedDict

required

list of mandatory fields.

Type list

optional

list of non-required fields.

Type list

false_values

accepted string values for False.

Type list

true_values

accepted values for True.

Type list

from_bool(value, validate=False)

Converts a boolean to a string

Parameters

- **value** (*bool*) logical value.
- **validate** (*bool*) when True raise a ValidationError for an invalid value. Otherwise, set invalid values to None.

Returns conversion of True or False or 'T' or 'F'.

Return type str

Raises airr.ValidationError – raised if value is invalid when validate is set True.

pandas_types()

Map of schema types to pandas types

Returns mapping dictionary for pandas types

Return type dict

spec(field)

Get the properties for a field

Parameters name (*str*) – field name.

Returns definition for the field.

Return type collections.OrderedDict

template()

Create an empty template object

Returns dictionary with all schema properties set as None or an empty list.

Return type collections.OrderedDict

to_bool(value, validate=False)

Convert a string to a boolean

Parameters

- **value** (*str*) logical value as a string.
- **validate** (*bool*) when True raise a ValidationError for an invalid value. Otherwise, set invalid values to None.

Returns conversion of the string to True or False.

Return type bool

Raises airr.ValidationError – raised if value is invalid when validate is set True.

to_float(value, validate=False)

Converts a string to a float

Parameters

- **value** (*str*) float value as a string.
- **validate** (*bool*) when True raise a ValidationError for an invalid value. Otherwise, set invalid values to None.

Returns conversion of the string to a float.

Return type float

Raises airr.ValidationError – raised if value is invalid when validate is set True.

to_int(value, validate=False)

Converts a string to an integer

Parameters

• **value** (*str*) – integer value as a string.

• **validate** (*bool*) – when True raise a ValidationError for an invalid value. Otherwise, set invalid values to None.

Returns conversion of the string to an integer.

Return type int

Raises airr.ValidationError – raised if value is invalid when validate is set True.

type(field)

Get the type for a field

Parameters name (*str*) – field name.

Returns the type definition for the field

Return type str

validate_header(header)

Validate header against the schema

Parameters header (*list*) – list of header fields.

Returns True if a ValidationError exception is not raised.

Return type bool

Raises airr.ValidationError – raised if header fails validation.

validate_object(obj, missing=True, nonairr=True, context=None)

Validate Repertoire object data against schema

Parameters

- **obj** (*dict*) dictionary containing a single repertoire object.
- **missing** (*bool*) provides warnings for missing optional fields.
- (bool (nonairr) provides warning for non-AIRR fields that cannot be validated.
- **context** (*string*) used by recursion to indicate place in object hierarchy

Returns True if a ValidationError exception is not raised.

Return type bool

Raises airr.ValidationError – raised if object fails validation.

validate_row(row)

Validate Rearrangements row data against schema

Parameters row (*dict*) – dictionary containing a single record.

Returns True if a ValidationError exception is not raised.

Return type bool

Raises airr.ValidationError – raised if row fails validation.

Schema

airr.schema.InfoSchema Schema object for the Info definition

AIRR schema definitions

airr.schema.**definition**

name of the schema definition.

airr.schema.info

schema info.

Type collections.OrderedDict

airr.schema.properties

field definitions.

Type collections.OrderedDict

airr.schema.**required**

list of mandatory fields.

Type list

airr.schema.**optional**

list of non-required fields.

Type list

airr.schema.**false_values**

accepted string values for False.

Type list

airr.schema.true_values

accepted values for True.

Type list

airr.schema.DataFileSchema Schema object for the DataFile definition

AIRR schema definitions

airr.schema.**definition**

name of the schema definition.

airr.schema.info

schema info.

Type collections.OrderedDict

airr.schema.properties

field definitions.

Type collections.OrderedDict

airr.schema.**required**

list of mandatory fields.

Type list

airr.schema.optional list of non-required fields. Type list airr.schema.false_values accepted string values for False. Type list airr.schema.true_values accepted values for True. Type list airr.schema.AlignmentSchema Schema object for the Alignment definition AIRR schema definitions airr.schema.definition name of the schema definition. airr.schema.**info** schema info. Type collections.OrderedDict airr.schema.properties field definitions. Type collections.OrderedDict airr.schema.**required** list of mandatory fields. Type list airr.schema.optional list of non-required fields. **Type** list airr.schema.false_values accepted string values for False. Type list airr.schema.true_values accepted values for True. Type list airr.schema.RearrangementSchema Schema object for the Rearrangement definition AIRR schema definitions airr.schema.definition name of the schema definition. airr.schema.info

schema info.

Type collections.OrderedDict

airr.schema.**properties**

field definitions.

Type collections.OrderedDict

airr.schema.**required**

list of mandatory fields.

Type list

airr.schema.**optional**

list of non-required fields.

Type list

airr.schema.false_values

accepted string values for False.

Type list

airr.schema.true_values

accepted values for True.

Type list

airr.schema.RepertoireSchema Schema object for the Repertoire definition

AIRR schema definitions

airr.schema.definition

name of the schema definition.

airr.schema.info

schema info.

Type collections.OrderedDict

airr.schema.properties

field definitions.

Type collections.OrderedDict

airr.schema.**required**

list of mandatory fields.

Type list

airr.schema.**optional**

list of non-required fields.

Type list

$\verb"airr.schema.false_values"$

accepted string values for False.

Type list

$\verb"airr.schema.true_values"$

accepted values for True.

Type list

airr.schema.GermlineSetSchema Schema object for the Repertoire definition

AIRR schema definitions

airr.schema.definition

name of the schema definition.

airr.schema.info

schema info.

Type collections.OrderedDict

airr.schema.properties

field definitions.

Type collections.OrderedDict

airr.schema.**required**

list of mandatory fields.

Type list

airr.schema.optional

list of non-required fields.

Type list

airr.schema.**false_values**

accepted string values for False.

Type list

airr.schema.true_values

accepted values for True.

Type list

airr.schema.GenotypeSetSchema Schema object for the Repertoire definition

AIRR schema definitions

airr.schema.definition

name of the schema definition.

airr.schema.info

schema info.

Type collections.OrderedDict

airr.schema.properties

field definitions.

Type collections.OrderedDict

airr.schema.**required**

list of mandatory fields.

Type list

airr.schema.**optional**

list of non-required fields.

Type list

airr.schema.**false_values**

accepted string values for False.

Type list

airr.schema.true_values

accepted values for True.

Type list

Deprecated

airr.load_repertoire(filename, validate=False, debug=False)

Load an AIRR repertoire metadata file

Parameters

- **filename** (*str*) path to the input file.
- **validate** (*bool*) whether to validate data as it is read, raising a ValidationError exception in the event of an error.
- debug (bool) debug flag. If True print debugging information to standard error.

Returns dictionary of AIRR Data objects.

Return type dict

Deprecated since version 1.4: Use *read_airr()* instead.

airr.write_repertoire(filename, repertoires, info=None, debug=False)

Write an AIRR repertoire metadata file

Parameters

- **file** (*str*) path to the output file.
- repertoires (list) array of repertoire objects.
- **info** (*object*) info object to write. Will write current AIRR Schema info if not specified.
- debug (bool) debug flag. If True print debugging information to standard error.

Returns True if the file is written without error.

Return type bool

Deprecated since version 1.4: Use write_airr() instead.

airr.validate_repertoire(filename, debug=False)

Validates an AIRR repertoire metadata file

Parameters

- **filename** (*str*) path of the file to validate.
- debug (bool) debug flag. If True print debugging information to standard error.

Returns True if files passed validation, otherwise False.

Return type bool

Deprecated since version 1.4: Use validate_airr() instead.

airr.repertoire_template()

Return a blank repertoire object from the template. This object has the complete structure with all of the fields and all values set to None or empty string.

Returns empty repertoire object.

Return type object

Deprecated since version 1.4: Use schema.Schema.template() instead.

Commandline Tools

Deprecated since version 1.4: The validate repertoire subcommand is deprecated. Use validate airrinstead.

airr-tools

AIRR Community Standards utility commands.

```
usage: airr-tools [-h] [--version] ...
```

-h, --help

show this help message and exit

--version

show program's version number and exit

airr-tools merge

Merge AIRR rearrangement files.

```
usage: airr-tools merge [--version] [-h] -o OUT_FILE [--drop] -a AIRR_FILES
[AIRR_FILES ...]
```

--version

show program's version number and exit

-h, --help

show this help message and exit

-o <out_file>

Output file name.

--drop

If specified, drop fields that do not exist in all input files. Otherwise, include all columns in all files and fill missing data with empty strings.

```
-a <airr_files>
```

A list of AIRR rearrangement files.

airr-tools validate

Validate files for AIRR Standards compliance.

```
usage: airr-tools validate [--version] [-h] ...
```

--version

show program's version number and exit

-h, --help

show this help message and exit

airr-tools validate airr

Validate AIRR Data Model files.

--version

show program's version number and exit

-h, --help

show this help message and exit

-a <airr_files>

A list of AIRR Data Model files.

airr-tools validate rearrangement

Validate AIRR rearrangement files.

```
usage: airr-tools validate rearrangement [--version] [-h] -a AIRR_FILES
[AIRR_FILES ...]
```

--version

show program's version number and exit

-h, --help

show this help message and exit

-a <airr_files>

A list of AIRR rearrangement files.

airr-tools validate repertoire

Validate AIRR repertoire metadata files.

usage:	airr-tools	validate	repertoire	[version]	[-h]	-a AIRR_FILES
				[AIRR_FILES]	

--version

show program's version number and exit

-h, --help

show this help message and exit

-a <airr_files>

A list of AIRR repertoire metadata files.

Python Library Release Notes

Version 1.4.1: August 27, 2022

General:

- 1. Updated pandas requirement to 0.24.0 or higher.
- 2. Added support for missing integer values (NaN) in load_rearrangement by casting to the pandas Int64 data type.
- 3. Added gzip support to read_rearrangement.
- 4. Significant internal refactoring to improve schema generalizability, harmonize behavior between the python and R libraries, and prepare for AIRR Standards v2.0.
- 5. Fixed a bug in the validate subcommand of airr-tools causing validation errors to only be reporting for the first invalid file when multiple files were specified on the command line.

Data Model and Schema:

- 1. Added support for arrays of objects in a single JSON or YAML file.
- 2. Added support for the AIRR Data File and associated schema (DataFile, Info). The Data File data format holds AIRR object of multiple types and is backwards compatible with Repertoire metadata.
- 3. Added support for the new germline and genotyping schema (GermlineSet, GenotypeSet) and associated schema.
- 4. Renamed schema.CachedSchema to schema.AIRRSchema.
- 5. Removed specs/blank.airr.yaml.

Deprecations:

- 1. Deprecated load_repertoire. Use read_airr instead.
- 2. Deprecated write_repertoire. Use write_airr instead.
- 3. Deprecated validate_repertoire. Use validate_airr instead.
- 4. Deprecated repertoire_template. Use schema.RepertoireSchema.template instead.
- 5. Deprecated the commandline tool airr-tools validate repertoire. Use airr-tools validate airr instead.

Version 1.3.1: October 13, 2020

- 1. Refactored merge_rearrangement to allow for larger number of files.
- 2. Improved error handling in format validation operations.

Version 1.3.0: May 30, 2020

- 1. Updated schema set to v1.3.
- 2. Added load_repertoire, write_repertoire, and validate_repertoire to airr.interface to read, write and validate Repertoire metadata, respectively.
- 3. Added repertoire_template to airr.interface which will return a complete repertoire object where all fields have null values.
- 4. Added validate_object to airr.schema that will validate a single repertoire object against the schema.
- 5. Extended the airr-tools commandline program to validate both rearrangement and repertoire files.

Version 1.2.1: October 5, 2018

1. Fixed a bug in the python reference library causing start coordinate values to be empty in some cases when writing data.

Version 1.2.0: August 17, 2018

- 1. Updated schema set to v1.2.
- 2. Several improvements to the validate_rearrangement function.
- 3. Changed behavior of all *airr.interface* functions to accept a file path (string) to a single Rearrangement TSV, instead of requiring a file handle as input.
- 4. Added base argument to RearrangementReader and RearrangementWriter to support optional conversion of 1-based closed intervals in the TSV to python-style 0-based half-open intervals. Defaults to conversion.
- 5. Added the custom exception ValidationError for handling validation checks.
- 6. Added the validate argument to RearrangementReader which will raise a ValidationError exception when reading files with missing required fields or invalid values for known field types.
- 7. Added validate argument to all type conversion methods in Schema, which will now raise a ValidationError exception for value that cannot be converted when set to True. When set False (default), the previous behavior of assigning None as the converted value is retained.
- 8. Added validate_header and validate_row methods to Schema and removed validations methods from RearrangementReader.
- 9. Removed automatic closure of file handle upon reaching the iterator end in RearrangementReader.

Version 1.1.0: May 1, 2018

Initial release.

Installation

Install in the usual manner from PyPI:

```
> pip3 install airr --user
```

Or from the downloaded source code directory:

```
> python3 setup.py install --user
```

Quick Start

Deprecation Notice

The load_repertoire, write_repertoire, and validate_repertoire functions have been deprecated for the new generic load_airr_data, write_airr_data, and validate_airr_data functions. These new functions are backwards compatible with the Repertoire metadata format but also support the new AIRR objects such as GermlineSet, RepertoireGroup, GenotypeSet, Cell and Clone. This new format is defined by the DataFile Schema, which describes a standard set of objects included in a file containing AIRR Data Model presentations. Currently, the AIRR DataFile does not completely support Rearrangement, so users should continue using AIRR TSV files and its specific functions. Also, the repertoire_template function has been deprecated for the Schema.template method, which can now be called on any AIRR Schema to create a blank object.

Reading AIRR Data Files

The airr package contains functions to read and write AIRR Data Model files. The file format is either YAML or JSON, and the package provides a light wrapper over the standard parsers. The file needs a json, yaml, or yml file extension so that the proper parser is utilized. All of the AIRR objects are loaded into memory at once and no streaming interface is provided:

import airr

```
# Load the AIRR data
data = airr.read_airr('input.airr.json')
# loop through the repertoires
for rep in data['Repertoire']:
    print(rep)
```

Why are the AIRR objects, such as Repertoire, GermlineSet, and etc., in a list versus in a dictionary keyed by their identifier (e.g., repertoire_id)? There are two primary reasons for this. First, the identifier might not have been assigned yet. Some systems might allow MiAIRR metadata to be entered but the identifier is assigned to that data later by another process. Without the identifier, the data could not be stored in a dictionary. Secondly, the list allows the data to have a default ordering. If you know that the data has a unique identifier then you can quickly create a dictionary object using a comprehension. For example, with repertoires:

rep_dict = { obj['repertoire_id'] : obj for obj in data['Repertoire'] }

another example with germline sets:

```
germline_dict = { obj['germline_set_id'] : obj for obj in data['GermlineSet'] }
```

Writing AIRR Data Files

Writing an AIRR Data File is also a light wrapper over standard YAML or JSON parsers. Multiple AIRR objects, such as Repertoire, GermlineSet, and etc., can be written together into the same file. In this example, we use the airr library template method to create some blank Repertoire objects, and write them to a file. As with the read function, the complete list of repertoires are written at once, there is no streaming interface:

```
import airr
# Create some blank repertoire objects in a list
data = { 'Repertoire': [] }
for i in range(5):
    data['Repertoire'].append(airr.schema.RepertoireSchema.template())
# Write the AIRR Data
airr.write_airr('output.airr.json', data)
```

Reading AIRR Rearrangement TSV files

The airr package contains functions to read and write AIRR Rearrangement TSV files as either iterables or pandas data frames. The usage is straightforward, as the file format is a typical tab delimited file, but the package performs some additional validation and type conversion beyond using a standard CSV reader:

```
import airr
# Create an iteratable that returns a dictionary for each row
reader = airr.read_rearrangement('input.tsv')
for row in reader: print(row)
# Load the entire file into a pandas data frame
df = airr.load_rearrangement('input.tsv')
```

Writing AIRR Rearrangement TSV files

Similar to the read operations, write functions are provided for either creating a writer class to perform row-wise output or writing the entire contents of a pandas data frame to a file. Again, usage is straightforward with the airr output functions simply performing some type conversion and field ordering operations:

```
import airr
# Create a writer class for iterative row output
writer = airr.create_rearrangement('output.tsv')
for row in reader: writer.write(row)
# Write an entire pandas data frame to a file
airr.dump_rearrangement(df, 'file.tsv')
```

By default, create_rearrangement will only write the required fields in the output file. Additional fields can be included in the output file by providing the fields parameter with an array of additional field names:

```
# Specify additional fields in the output
fields = ['new_calc', 'another_field']
writer = airr.create_rearrangement('output.tsv', fields=fields)
```

A common operation is to read an AIRR rearrangement file, and then write an AIRR rearrangement file with additional fields in it while keeping all of the existing fields from the original file. The derive_rearrangement function provides this capability:

```
import airr
# Read rearrangement data and write new file with additional fields
reader = airr.read_rearrangement('input.tsv')
fields = ['new_calc']
writer = airr.derive_rearrangement('output.tsv', 'input.tsv', fields=fields)
for row in reader:
    row['new_calc'] = 'a value'
    writer.write(row)
```

Validating AIRR data files

The airr package can validate AIRR Data Model JSON/YAML files and Rearrangement TSV files to ensure that they contain all required fields and that the fields types match the AIRR Schema. This can be done using the airr-tools command line program or the validate functions in the library can be called:

```
# Validate a rearrangement TSV file
airr-tools validate rearrangement -a input.tsv
# Validate an AIRR DataFile
airr-tools validate airr -a input.airr.json
```

Combining Repertoire metadata and Rearrangement files

The airr package does not currently keep track of which AIRR Data Model files are associated with which Rearrangement TSV files, though there is ongoing work to define a standardized manifest, so users will need to handle those associations themselves. However, in the data, AIRR identifier fields, such as repertoire_id, form the link between objects in the AIRR Data Model. The typical usage is that a program is going to perform some computation on the Rearrangements, and it needs access to the Repertoire metadata as part of the computation logic. This example code shows the basic framework for doing that, in this case doing gender specific computation:

```
import airr
# Load AIRR data containing repertoires
data = airr.read_airr('input.airr.json')
# Put repertoires in dictionary keyed by repertoire_id
rep_dict = { obj['repertoire_id'] : obj for obj in data['Repertoire'] }
# Create an iteratable for rearrangement data
```

(continues on next page)

(continued from previous page)

```
reader = airr.read_rearrangement('input.tsv')
for row in reader:
    # get repertoire metadata with this rearrangement
    rep = rep_dict[row['repertoire_id']]

    # check the gender
    if rep['subject']['sex'] == 'male':
        # do male specific computation
    elif rep['subject']['sex'] == 'female':
        # do female specific computation
    else:
        # do other specific computation
```

R Library

airr is an R package for working with data formatted according to the AIRR Standards schemas. It includes the full set of schema definitions along with simple functions for read, write and validation.

Usage Vignette

Introduction

Since the use of High-throughput sequencing (HTS) was first introduced to analyze immunoglobulin (B-cell receptor, antibody) and T-cell receptor repertoires (Freeman et al, 2009; Robins et al, 2009; Weinstein et al, 2009), the increasing number of studies making use of this technique has produced enormous amounts of data and there exists a pressing need to develop and adopt common standards, protocols, and policies for generating and sharing data sets. The Adaptive Immune Receptor Repertoire (AIRR) Community formed in 2015 to address this challenge (Breden et al, 2017) and has stablished the set of minimal metadata elements (MiAIRR) required for describing published AIRR datasets (Rubelt et al, 2017) as well as file formats to represent this data in a machine-readable form. The airr R package provide read, write and validation of data following the AIRR Data Representation schemas. This vignette provides a set of simple use examples.

AIRR Data Standards

The AIRR Community's recommendations for a minimal set of metadata that should be used to describe an AIRR-seq data set when published or deposited in a AIRR-compliant public repository are described in Rubelt et al, 2017. The primary aim of this effort is to make published AIRR datasets FAIR (findable, accessible, interoperable, reusable); with sufficient detail such that a person skilled in the art of AIRR sequencing and data analysis will be able to reproduce the experiment and data analyses that were performed.

Following this principles, V(D)J reference alignment annotations are saved in standard tab-delimited files (TSV) with associated metadata provided in accompanying YAML formatted files. The column names and field names in these files have been defined by the AIRR Data Representation Working Group using a controlled vocabulary of standardized terms and types to refer to each piece of information.

Reading AIRR formatted files

The airr package contains the function read_rearrangement to read and validate files containing AIRR Rearrangement records, where a Rearrangement record describes the collection of optimal annotations on a single sequence that has undergone V(D)J reference alignment. The usage is straightforward, as the file format is a typical tabulated file. The argument that needs attention is base, with possible values "0" and "1". base denotes the starting index for positional fields in the input file. Positional fields are those that contain alignment coordinates and names ending in "_start" and "_end". If the input file is using 1-based closed intervals (R style), as defined by the standard, then positional fields will not be modified under the default setting of base="1". If the input file is using 0-based coordinates with half-open intervals (python style), then positional fields may be converted to 1-based closed intervals using the argument base="0".

Reading Rearrangements

```
# Imports
library(airr)
library(tibble)
# Read Rearrangement example file
f1 <- system.file("extdata", "rearrangement-example.tsv.gz", package="airr")
rearrangement <- read_rearrangement(f1)
glimpse(rearrangement)
```

```

Reading AIRR Data Models

AIRR Data Model records, such as Repertoire and GermlineSet, can be read from either a YAML or JSON formatted file into a nested list.

```
# Read Repertoire example file
f2 <- system.file("extdata", "repertoire-example.yaml", package="airr")
repertoire <- read_airr(f2)
glimpse(repertoire)</pre>
```

```

```

Writing AIRR formatted files

The airr package contains the function write_rearrangement to write Rearrangement records to the AIRR TSV format.

Writing Rearrangements

```
x1 <- file.path(tempdir(), "airr_out.tsv")
write_rearrangement(rearrangement, x1)</pre>
```

Writing AIRR Data Models

AIRR Data Model records can be written to either YAML or JSON using the write_airr function.

```
x2 <- file.path(tempdir(), "airr_repertoire_out.yaml")
write_airr(repertoire, x2, format="yaml")
x3 <- file.path(tempdir(), "airr_germline_out.json")
write_airr(germline, x3, format="json")</pre>
```

Validating AIRR data structures

The airr package contains the function validate_rearrangement to validate tabular (data.frame) Rearrangement records and AIRR Data Model objects, respectively.

Validate Rearrangement data.frame
validate_rearrangement(rearrangement)

[1] TRUE

```
# Validate an AIRR Data Model
validate_airr(repertoire)
```

[1] TRUE

Validate AIRR Data Model records individual validate_airr(germline, each=TRUE)

GenotypeSet GermlineSet
TRUE TRUE

Reference Topics

read_tabular

Read AIRR tabular data

Description

read_tabular reads a tab-delimited (TSV) file containing tabular AIRR records.

Usage

```
read_tabular(file, schema, base = c("1", "0"), aux_types = NULL, ...)
```

```
read_rearrangement(file, base = c("1", "0"), ...)
```

read_alignment(file, base = c("1", "0"), ...)

Arguments

file input file path.

schema Schema object defining the output format.

- **base** starting index for positional fields in the input file. If "1", then these fields will not be modified. If "0", then fields ending in "_start" and "_end" are 0-based half-open intervals (python style) in the input file and will be converted to 1-based closed-intervals (R style).
- aux_types named vector or list giving the type for fields that are not defined in schema. The field name is the name, the value the type, denoted by one of "c" (character), "1" (logical), "i" (integer), "d" (double), or "n" (numeric).

... additional arguments to pass to read_delim.

Value

A data.frame of the TSV file with appropriate type and position conversion for fields defined in the specification.

Details

read_rearrangement reads an AIRR TSV containing Rearrangement data.

read_alignment reads an AIRR TSV containing Alignment data.

Examples

```
# Get path to the rearrangement-example file
file <- system.file("extdata", "rearrangement-example.tsv.gz", package="airr")
# Load data file
df <- read_rearrangement(file)</pre>
```

See also

See Schema for the AIRR schema object definition. See write_tabular for writing AIRR data.

read_airr

Read an AIRR Data Model file in YAML or JSON format

Description

read_airr loads a YAML or JSON file containing AIRR Data Model records.

Usage

```
read_airr(
file,
format = c("auto", "yaml", "json"),
validate = TRUE,
model = TRUE
)
```

Arguments

file path to the input file.

- format format of the input file. Must be one of "auto", "yaml", or "json". If "auto" (default), the format will be detected from the file extension.
- validate run schema validation if TRUE.
- model if TRUE validate only AIRR DataFile defined objects. If FALSE attempt validation of all objects in data. Ignored if validate=FALSE

Value

A named nested list contained in the AIRR Data Model with the top-level names reflecting the individual AIRR objects.

Examples

```
# Get path to the Reportoire and GermlineSet example files
f1 <- system.file("extdata", "repertoire-example.yaml", package="airr")
f2 <- system.file("extdata", "germline-example.json", package="airr")
# Load data files
repertoire <- read_airr(f1)
germline <- read_airr(f2)</pre>
```

See also

See Schema for the AIRR schema definition objects. See write_airr for writing AIRR Data Model records in YAML or JSON format.

write_tabular

Write an AIRR tabular data

Description

write_tabular writes a TSV containing AIRR tabular records.

Usage

```
write_tabular(data, file, schema, base = c("1", "0"), ...)
```

```
write_rearrangement(data, file, base = c("1", "0"), ...)
```

```
write_alignment(data, file, base = c("1", "0"), ...)
```

Arguments

data data.frame of Rearrangement data.

file output file name.

schema Schema object defining the output format.

base starting index for positional fields in the output file. Fields in the input data are assumed to be 1-based closed-intervals (R style). If "1", then these fields will not be modified. If "0", then fields ending in _start and _end will be converted to 0-based half-open intervals (python style) in the output file.

... additional arguments to pass to write_delim.

Details

write_rearrangement writes a data.frame containing AIRR Rearrangement data to TSV.

write_alignment writes a data.frame containing AIRR Alignment data to TSV.

Examples

```
# Get path to the rearrangement-example file
file <- system.file("extdata", "rearrangement-example.tsv.gz", package="airr")
# Load data file
df <- read_rearrangement(file)</pre>
```

```
# Write a Rearrangement data file
outfile <- file.path(tempdir(), "output.tsv")
write_tabular(df, outfile, schema=RearrangementSchema)</pre>
```

See also

See Schema for the AIRR schema object definition. See read_tabular for reading to AIRR files.

write_airr

Write AIRR Data Model records to YAML or JSON files

Description

write_airr writes a YAML or JSON file containing AIRR Data Model records.

Usage

```
write_airr(
data,
file,
format = c("auto", "yaml", "json"),
validate = TRUE,
model = TRUE
)
```

Arguments

data list containing AIRR Model Records.

file output file name.

format format of the output file. Must be one of "auto", "yaml", or "json". If "auto" (default), the format will be detected from the file extension.

validate run schema validation prior to write if TRUE.

model if TRUE validate and write only AIRR DataFile defined objects. If FALSE attempt validation and write of all objects in data.

Examples

```
# Get path to the repertoire-example file
file <- system.file("extdata", "repertoire-example.yaml", package="airr")
# Load data file
repertoire <- read_airr(file)
# Write a Rearrangement data file
outfile <- file.path(tempdir(), "output.yaml")
write_airr(repertoire, outfile)
```

See also

See Schema for the AIRR schema definition objects. See read_airr for reading to AIRR Data Model files.

validate_tabular

Validate tabular AIRR data

Description

validate_tabular validates compliance of the contents of a data.frame to the AIRR standards.

Usage

validate_tabular(data, schema)

validate_rearrangement(data)

Arguments

data data.frame of tabular data to validate.

schema Schema object defining the data standard of the table.

Value

Returns TRUE if the input data is compliant and FALSE if not.

Details

validate_rearrangement validates the standards compliance of AIRR Rearrangement data stored in a data.frame

Examples

```
# Get path to the rearrangement-example file
file <- system.file("extdata", "rearrangement-example.tsv.gz", package="airr")</pre>
```

```
# Load data file
df <- read_rearrangement(file)</pre>
```

```
# Validate a data.frame against the Rearrangement schema
validate_rearrangement(df)
```

[1] TRUE

validate_airr

Validate an AIRR Data Model nested list representation

Description

validate_airr validates the fields in a named nested list representation of the AIRR Data Model. Typically, generating by reading of JSON or YAML formatted AIRR files.

Usage

validate_airr(data, model = TRUE, each = FALSE)

Arguments

data list containing records of an AIRR Data Model objected imported from a YAML or JSON representation.model if TRUE validate only AIRR DataFile defined objects. If FALSE attempt validation of all objects in data.each if TRUE return a logical vector with results for each object in data instead of a single TRUE or FALSE value.

Value

Returns TRUE if the input data is compliant with AIRR standards and FALSE if not. If each=TRUE is set, then a vector with results for each each object in data is returned instead.

Examples

```
# Get path to the rearrangement-example file
f1 <- system.file("extdata", "repertoire-example.yaml", package="airr")
f2 <- system.file("extdata", "germline-example.json", package="airr")
# Load data file
repertoire <- read_airr(f1)
germline <- read_airr(f2)</pre>
```

[1] TRUE

```
# Return validation for individual objects
validate_airr(germline, each=TRUE)
```

```
GenotypeSet GermlineSet
TRUE TRUE
```

Validate a single record validate_airr(repertoire)

See also

See Schema for the AIRR schema definitions. See read_airr for loading AIRR Data Models from a file. See write_airr for writing AIRR Data Models to a file.

load_schema

Load a schema definition

Description

load_schema loads an AIRR object definition from the internal definition set.

Usage

load_schema(definition)

Arguments

definition name of the schema definition.

Value

A Schema object for the definition.

Details

Valid definitions include:

- "Rearrangement"
- "Alignment"
- "Repertoire"
- "Study"
- "Subject"
- "Diagnosis"
- "Sample"
- "SampleProcessing"
- "DataProcessing"
- "GermlineSet"
- "GenotypeSet"

Examples

```
# Load the Rearrangement definition
schema <- load_schema("Rearrangement")
# Load the Repertoire definition
schema <- load_schema("Repertoire")</pre>
```

See also

See Schema for the return object.

Schema-class

S4 class defining an AIRR standard schema

Description

Schema defines a common data structure for AIRR Data Representation standards.

Usage

"names"(x)			
"["(x, i)			
"\$"(x, name)			
InfoSchema			
DataFileSchema			
AlignmentSchema			
RearrangementSchema			
RepertoireSchema			
GermlineSetSchema			
GenotypeSetSchema			
AIRRSchema			

Arguments

x Schema object.

i field name.

name field name.

Format

A Schema object.

An object of class Schema of length 1. An object of class Schema of length 1. An object of class Schema of length 1.

An object of class Schema of length 1.

An object of class Schema of length 1.

An object of class Schema of length 1.

An object of class Schema of length 1.

An object of class list of length 26.

Details

The following predefined Schema objects are defined: InfoSchema: AIRR Info Schema. DataFileSchema: AIRR DataFile Schema. AlignmentSchema: AIRR Alignment Schema. RearrangementSchema: AIRR Rearrangement Schema. RepertoireSchema: AIRR Repertoire Schema. GermlineSetSchema: AIRR GermlineSet Schema. GenotypeSetSchema: AIRR GenotypeSet Schema. AIRRSchema: named list containing all non-experimental AIRR Schema objects.

Slots

definition name of the schema definition.
required character vector of required fields.
optional character vector of non-required fields.
properties list of field definitions.
info list schema information.

See also

See load_schema for loading a Schema from the definition set.

ExampleData

Example AIRR data

Description

Example data files compliant with the the AIRR Data Representation standards.

Format

- extdata/rearrangement-example.tsv.gz: Rearrangement TSV file.
- extdata/repertoire-example.yaml: Repertoire YAML file.
- extdata/germline-example.json: GermlineSet and GenotypeSet JSON file.

Examples

```
# Load Rearrangement example
file <- system.file("extdata", "rearrangement-example.tsv.gz", package="airr")
rearrangement <- read_rearrangement(file)</pre>
```

```
# Load Repertoire example
file <- system.file("extdata", "repertoire-example.yaml", package="airr")
repertoire <- read_airr(file)
# Load GermlineSet and GenotypeSet examples
file <- system.file("extdata", "germline-example.json", package="airr")</pre>
```

Release Notes

Version 1.4.1: August 27, 2022

germline <- read_airr(file)</pre>

Significant internal refactoring to improve schema generalizability, harmonize behavior between the python and R libraries, and prepare for AIRR Standards v2.0.

Rearrangement:

- Added the aux_types argument to read_tabular, read_rearrangement, and read_alignment to allow explicit declaration of the type for fields that are not defined in the schema.
- Renamed read_airr, write_airr, and validate_airr to read_tabular, validate_tabular, and validate_tabular, respectively.

Data Model and Schema:

- Defined new read_airr, write_airr, and validate_airr functions that support AIRR Data Model files that store arrays of objects in JSON or YAML.
- Added support for the AIRR Model Data File and associated schema (DataFile, Info). The Data File data format holds AIRR object of multiple types and is backwards compatible with Repertoire metadata.
- Added support for the new germline and genotyping schema (GermlineSet, GenotypeSet) and associated schema.

Version 1.3.0: May 26, 2020

- Updated schema set to v1.3.
- Added info slot to Schema object containing general schema information.

Version 1.2.0: August 17, 2018

- Updated schema set to v1.2.
- Changed defaults to base="1" for read and write functions.
- Updated example TSV file with coordinate changes, addition of germline_alignment data and simplification of sequence_id values.

Version 1.1.0: May 1, 2018

Initial release.

Download & Installation

To install the latest release from CRAN:

install.packages("airr")

To build from the source code, first install the build dependencies:

```
install.packages(c("devtools", "roxygen2"))
```

To install the latest development code via devtools:

```
library(devtools)
install_github("airr-community/airr-standards/lang/R@master")
```

Note, using install_github will not build the documentation. To generate the documentation, clone the repository, and then build as normal using the following R commands from the package root lang/R:

```
library(devtools)
install_deps(dependencies=T)
document()
install()
```

Dependencies

Depends: FALSE **Imports:** jsonlite, methods, readr, stats, stringi, tools, yaml **Suggests:** knitr, rmarkdown, tibble, testthat

ADC API Reference Implementation

The AIRR Community provides a reference implementation for an ADC API service. The reference implementation can be utilized for any number of tasks. For example, a data repository might use the source code as a starting point for their own implementation and can compare the behaviour of their service against the reference. Another example is a tool developer, who wishes to use the API, can setup a local data repository so they can develop and test their tool before sending API requests across the internet to remote data repositories. While the reference implementation is functionally complete, it has minimal security and no optimizations for large data so it should not be used directly for production systems.

The reference implementation consists of three GitHub repositories: adc-api, adc-api-js-mongodb, and adc-apimongodb-repository. The three repositories correspond to the top-level service composition (adc-api), a JavaScript web service that responds to API requests and queries a MongoDB database (adc-api-js-mongodb), and a MongoDB database for holding AIRR-seq data (adc-api-mongodb-repository). Docker and docker-compose are used to provide a consistent deployment environment and compose the multiple components together into a single service. Complete documentation for configuring and deploying the reference implementation is available in the adc-api repository.

2.5.2 Resources and Tools Supporting AIRR Standards

Applications Supporting the Rearrangement Schema

The following list of software tools and databases support the TSV format of v1.2 (or higher) of the *AIRR Rearrangement schema*.

Software	Version	Support	Reference
AIRR Python Library	1.2	Input, output and validation	Vander Heiden et al. Front Im- munol, 2018.
AIRR R Library	1.2	Input, output and validation	Vander Heiden et al. Front Im- munol, 2018.
Alakazam	1.0.1	Input and output	Gupta & Vander Heiden et al. Bioinformatics, 2015.
Cell Ranger	4.0	Output	10x Genomics, Inc. Pleasanton, CA USA.

AIRR Data Commons Repositories

These data repositories all implement the AIRR Data Commons (ADC) API programmatic access to query and down-load AIRR-seq data.

- iReceptor Public Archive (Canada)
- *iReceptor COVID-19 Repository* (Canada)
- VDJServer Community Data Portal (US)
- sciReptor (Germany)
- VDJBase (Canada)
- NICD (Africa)
- University of Muenster (Germany)

2.6 Community Resources

2.6.1 Resources and Tools Supporting AIRR Standards

2.6.2 Useful Websites for the AIRR Community

- The Antibody Society
- The AIRR Community of the Antibody Society
- B-T.CR Forum
- The AIRR Community GitHub
- The AIRR Standards GitHub Repository
- The AIRR Community Docker Hub

2.7 Appendix A: Key Terms

The following table provides definitions for terms and acronyms relevant to this documentation.

Term	Definition	
ADC	AIRR Data Commons	
AIRR	Adaptive Immune Receptor Repertoire	
AIRR-C	RR-C AIRR Community	
API	Application Programming Interface	
CAIRR	CEDAR AIRR	
CEDAR	Center for Expanded Data Annotation and Retrieval	
HTTP	TTP Hypertext Transfer Protocol	
JSON	JavaScript Object Notation	
MiAIRR	Minimal Information about an Adaptive Immune Receptor Repertoire study	
REST	Representational State Transfer	
TSV	Tab Separated Values	
URL	Universal Resource Locator	
YAML	YAML Ain't Markup Language
